## Advice for users

AUTOSAR Specification Documents may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the Specification Documents for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such Specification Documents, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

# 1 Introduction and functional overview

The Function Inhibition Manager is responsible for providing a control mechanism for software components and the functionality therein. In this context, a functionality can be built up of the contents of one, several or parts of runnable entities with the same set of permission / inhibit conditions. By means of the FIM, inhibiting (→ deactivation of application function) these functionalities can be configured and even modified during runtime (post-built configuration).

Functionality and runnable entity are different and independent types of classifications. Runnable entities are mainly characterized by their scheduling requirements. In contrast to that, functionalities are classified by their inhibit conditions. The services of the FIM focus on functionalities in SW-Cs, however, they are not limited to them. Functionalities of the BSW can also use the FIM services.

The functionalities are assigned to an identifier (FID – function identifier) along with the inhibit conditions for that particular identifier. The functionalities poll for the permission state of their respective FIDs before execution. If an inhibit condition comes true for a particular identifier, the corresponding functionality shall not be executed anymore.

The FIM is closely related to the DEM since diagnostic events and their status information are supported as inhibit conditions. Hence, functionality which needs to be stopped in case of a failure, e.g. of a certain sensor, can be represented by a particular identifier. If the failure is detected and the event is reported to the DEM, the FIM then inhibits the FID and therefore the corresponding functionality.

In order to handle the relation of functionality and linked events, the identifier and inhibit conditions of the functionality have been introduced into the SW-C template (equivalence for BSW) and during configuration, data structures are built up to deal with the sensitiveness of the identifiers against certain events

Software components can be integrated into a new environment as a collection of events which can be configured without big effort. Furthermore, system analysis is supported when questions as, for example, “Which functionality is inhibited if a particular event is detected?” arise. The data basis of the FIM serves as documentation of the configured relations between events and the SW-C to be inhibited.

In AUTOSAR, the RTE deals with SW-C in terms of their interfaces and scheduling requirements. In contrast to that, the FIM deals with inhibit conditions and provides supporting mechanisms for controlling functionalities via respective identifiers (FID). Therefore, the FIM concept and RTE concept do not interfere with each other.

The basic targets of the FIM specification document are:

- Standardization of APIs
- Introduction of possible implementation approaches
- Provide the ability for a common approach of OEM and supplier

## 2 Acronyms and abbreviations

Abbreviation / Acronym:	Description:
Activity state	The activity state is the status of a software component being executed. The activity state results from the permission state as a precondition and physical enable condition, too. It is not calculated by the FIM and not available as a status variable. It can only be derived from local information within a software component. For further details, see chapter 7.2.1.4.
API	Application Programming Interface
BSW	Basic Software
DEM	Diagnostic Event Manager
ECU	Electronic Control Unit
FID	Function Identifier
FIM	Function Inhibition Manager
Functionality	<p>Functionality comprises User-visible and User-non-visible functional aspects of a system (AUTOSAR_Glossary.pdf).</p> <p>In addition to that - in the FIM context - a functionality can be built up of the contents of one, several or parts of runnable entities with the same set of permission / inhibit conditions. By means of the FIM, the inhibition of these functionalities can be configured and even modified by calibration. Each functionality is represented by a unique FunctionId. A functionality is characterized by a specific set of inhibit condition in contrast to runnable entities having specific scheduling conditions.</p>
HW	Hardware
ID	Identification/Identifier
ISO	International Standardization Organization
MIL	Malfunction Indication Light
Monitoring function	<ul style="list-style-type: none"> <li>Part of the Software Component.</li> <li>Mechanism to monitor and finally to detect a fault of a certain sensor, actuator or could be a plausibility check</li> <li>Reports states about events from internal processing of a SW-C or from further processing of return values of other basic software modules.</li> <li>See also AUTOSAR_SWS_DEM</li> </ul>
NVRAM	Non volatile Memory
OBD	On-board Diagnostics
OBDII	Emission-related On-board Diagnostics
OEM	Original Equipment Manufacturer
OS	Operating System
Permission state	The permission state contains the information whether a functionality, represented by its FID, can be executed or whether it shall not run. The state is controlled by the FIM based on reported events. For further details, see chapter 7.2.1.4.
RAM	Random Access Memory
ROM	Read-only Memory
RTE	Runtime Environment
Runnable entity	A Runnable Entity is a part of an Atomic Software-Component, which can be executed and scheduled independently from the other Runnable Entities of this Atomic Software-Component. It is described by a sequence of instructions that can be started by the RTE. Each runnable entity is associated with exactly one EntryPoint.
SW-C	Software Component
UDS	Unified Diagnostic Services
WP	Autosar Work Package
Xxx_	Placeholder for an API provider

## 4 Constraints and assumptions

**[FIM007]** 「FID numbers shall be unique per FIM.」(BSW04701)

Since communication between software components and basic software is limited to one ECU, the FIM can only control FIDs being located on the same ECU. Note that the RTE does currently not support communication between basic software and software components located on different ECUs.

## 4.1 Limitations

Timing constraints have to be considered for the whole system. Note that the process and response times strongly depend on the implementation of the FIM module. Hence, if there are explicit needs for faster responses of the FIM than the cycle (time slice of the task) these needs have to be considered by the FIM implementation specifically by the affected application. Special measures have to be implemented by the FIM which are not explicitly specified in this AUTOSAR document, since here, the implementation is – on purpose – not prescribed.

**[FIM043]** 「The FIM shall compute the permission of a FID independently of the state of other FIDs.」(BSW04706)

Interdependencies between FIDs are not supported by the FIM. That means an FID does not influence another FID.

## 4.2 Applicability to car domains

The FIM is designed to fulfill the design demands for ECUs with respect to a central handling of reactions of the system upon detected malfunctions, e.g. open circuit or shortcut. Therefore, the immediate domain of applicability of the FIM is currently body, chassis and powertrain ECUs. However, there is no reason that the FIM cannot be used in implementations of ECUs for other car domains as, for example, infotainment.

One major constraint is that the FIM alone will NOT be able to handle SW-Components that are:

1. time critical – They might be too slow for local reconfigurations (fast backup reaction in case of e.g. invalid signals).
2. physically interactive – They might not be sufficiently flexible.
3. safety critical – They might not have sufficient software integrity.

## 5 Dependencies on other modules

**[FIM044]** 「The AUTOSAR **Function Inhibition Manager (FIM)** has interfaces and dependencies on the Diagnostic Event Manager (DEM), the Software Components (SW-C) with FID interface, the ECU State Manager, the RTE and the BSW modules supposed to be inhibited by the FIM.」(BSW00384)

- The **Diagnostic Event Manager (DEM)** is in charge of handling detected malfunctions denoted as events and reported by monitoring functions. The DEM informs and updates the Function Inhibition Manager (FIM) upon changes of the event status in order to stop or release functionalities according to assigned dependencies.
- **SW-Components (SW-C) with FID interface** query for permission to execute functionality identified by an FID at the FIM. The FIDs have to be provided by the SW components.
- **ECU State manager** is responsible for the basic initialization and de-initialization of BSW-components.
- **BSW module(s)** that are supposed to be inhibited by the FIM shall use the FIM interface to ask for permission. Therefore, the affected BSW modules have to provide the corresponding configuration data (EventID – FID – Inhibition mask relation) at configuration time realized by using a template similar to the SW-component template. The interface handling for BSW modules corresponds to the interface handling for SW-components.
- **The RTE** implements scheduling mechanisms for BSW, e.g. assigns priority and memory protection to each BSW module used in an ECU.

## 5.1 AUTOSAR service

This chapter is an extension to the specification of the FIM, which currently defines the behavior, and the C-interfaces of the FIM module as part of the basic software. Based on the specification, this chapter formally specifies the corresponding AUTOSAR Service, which is visible on the VFB.

### 5.1.1 Architecture

In the AUTOSAR ECU Architecture [2], the Diagnostic Event Manager [10] implements an AUTOSAR Service, which is responsible for the handling and storage of faults.

## 5.2 Requirements

There are three sources of requirements for this specification:

- The requirements for the functionality of the FIM service are specified in [4]. In order to model the VFB view of the Service, the chapter on AUTOSAR Services of the VFB specification [8] has to be considered as an additional requirement.
- For the formal description of the SW-C attributes [11] gives the requirements.

### 5.2.1 Use Cases

On each ECU, typically one instance of the FIM Service and several Atomic Software Component instances using this Service are employed. The Atomic Software Components are named “clients” further on in this document.

Additionally, there are parts of the basic software, which either control the FIM Manager (e.g. the ECU State Manager for initialization and shutdown) or need to query the FIM for execution permission themselves.

## **5.3 Specification of the Ports and Port Interfaces**

This chapter specifies the ports and port interfaces which are needed in order to operate the FIM functionality over the VFB.

### **5.3.1 Description of the Interfaces**

## 5.4 Internal behavior

Function identifiers are configured per FIM. The FIM Specification does not standardize the basic type to be used for identifying function identifiers, since the required value range is ECU dependent. This type has to be defined for a specific ECU as follows:

```
ImplementationDataType FunctionIdType {  
    LOWER-LIMIT = 0;  
    UPPER-LIMIT = <xx>;  
};
```

This type does not show up in the service ports of the client components because the block identifier is implemented as port defined argument value which is part of the InternalBehavior of the FIM Service. So the ECU dependency of FunctionIdType is not visible for the clients.

The InternalBehavior of the FIM Service is only seen by the local RTE. Additionally to the definition of the block identifiers as port defined arguments, it must specify the operation invoked runnables:

```
InternalBehavior FiM {  
  
    // definition of associated operation-invoked RTE-events not shown  
    // (it is done in the same way as for any SWC type)  
  
    // section "runnable entities":  
    RunnableEntity GetFunctionPermission  
        symbol "FiM_GetFunctionPermission"  
        canBeInvokedConcurrently = TRUE  
}
```

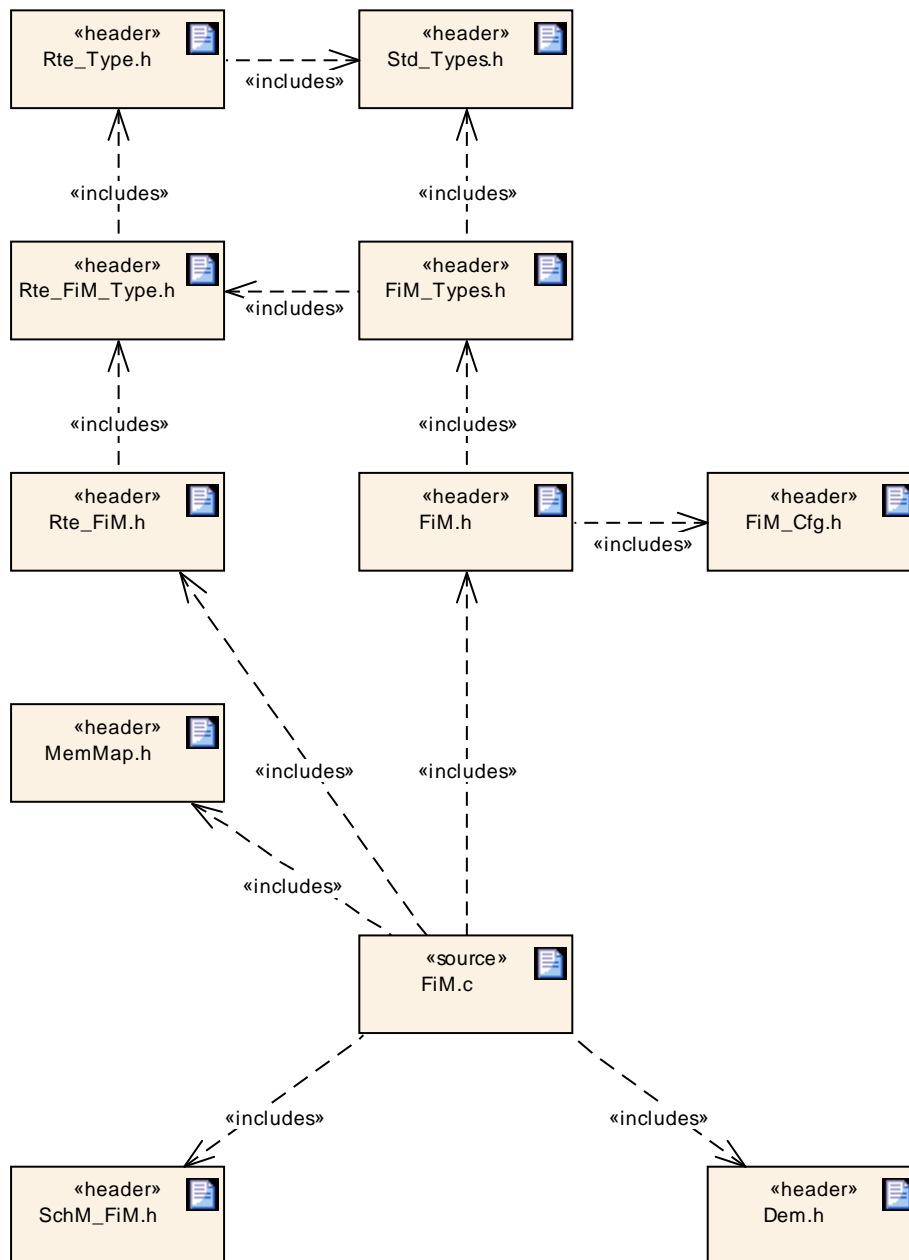

## 5.5 Configuration of the FIDs

The FIDs of the FIM are modeled as “port defined argument values”. Thus, the configuration of those values is part of the RTE configuration. Pre-compile configuration can be done by changing the XML specification for the argument values on the FIM Service for the FIDs. Note that the ports visible on the client side are not affected by this.

## 5.6 File structure

**[FIM030]** «The FIM module shall provide a file named `FiM_PBcfg.c` containing all post build time configurable parameters.»(BSW00380, BSW00419)

**[FIM029]** «The FIM module shall adhere to the following include file structure:»(BSW00346, BSW00348, BSW00381, BSW00383, BSW00412, BSW00415, BSW00435, BSW00436, BSW00447)

**[FIM031]** «The FIM module shall include the `Dem.h` file.»(BSW00383)  
By this inclusion, EventId Symbols and the API to read the event status are included.

**[FIM092]** The file `FiM_Types.h` shall include `Rte_FiM_Type.h` to include the types which are common used by BSW Modules and Software Components. `FiM_Types.h` and `FiM.h` shall only contain types that are not already defined in `Rte_FiM_Type.h`.

[BSW00159] Tool-based configuration	Not applicable (Requirement for tool WP)
[BSW00160] Human-readable configuration data	Not applicable (Requirement for tool WP)
[BSW00161] Microcontroller abstraction	Not applicable (requirement for $\mu$ C abstraction layer)
[BSW00162] ECU layout abstraction	Not applicable (requirement for $\mu$ C abstraction layer)
[BSW00164] Implementation of interrupt service routines	Not applicable (requirement for OS, complex drivers and $\mu$ C abstraction)
[BSW00166] BSW Module interfaces	<a href="#">FIM004</a> , <a href="#">FIM006</a> , <a href="#">FIM011</a> , <a href="#">FIM021</a>
[BSW00167] Static configuration checking	Not applicable (Requirement for tool WP)
[BSW00168] Diagnostic Interface of SW components	Not applicable (requirement for DCM)
[BSW00170] Data for reconfiguration of AUTOSAR SW-Components	Not applicable (requirement for application layer)
[BSW00171] Configurability of optional functionality	<a href="#">FIM032</a> , <a href="#">FIM033</a> , <a href="#">FIM040</a>
[BSW00172] Compatibility and documentation of scheduling strategy	Not applicable (Documentation requirement)
[BSW00300] Module naming convention	Implemented
[BSW00301] Limit imported information	Not applicable (Implementation requirement)
[BSW00302] Limit exported information	Not applicable (Implementation requirement)
[BSW00304] AUTOSAR integer data types	<a href="#">FIM027</a> <a href="#">FIM041</a>
[BSW00305] Self-defined data types naming convention	<a href="#">FIM027</a>
[BSW00306] Avoid direct use of compiler and platform specific keywords	Not applicable (Implementation requirement)
[BSW00307] Global variables naming convention	Not applicable (Implementation requirement)
[BSW00308] Definition of global data	Not applicable (Implementation requirement)
[BSW00309] Global data with read-only constraint	Not applicable (Implementation requirement)
[BSW00310] API naming convention	<a href="#">FIM004</a> , <a href="#">FIM006</a> , <a href="#">FIM011</a> , <a href="#">FIM021</a>
[BSW00312] Shared code shall be reentrant	<a href="#">FIM011</a> , <a href="#">FIM021</a>

Requirement	Satisfied by
[BSW00314] Separation of interrupt frames and service routines	Not applicable (Implementation requirement)
[BSW00318] Format of module version numbers	<a href="#">FIM041</a>
[BSW00321] Enumeration of module version numbers	<a href="#">FIM041</a>
[BSW00323] API parameter checking	Not applicable (Implementation requirement)
[BSW00324] Do not use HIS I/O Library	Not applicable (requirement for $\mu$ C abstraction layer)
[BSW00325] Runtime of interrupt service routines	Not applicable (Implementation requirement)
[BSW00326] Transition from ISRs to OS tasks	Not applicable (requirement for OS and RTE)
[BSW00327] Error values naming convention	<a href="#">FIM047</a>
[BSW00328] Avoid duplication of code	Not applicable (Implementation requirement)
[BSW00329] Avoidance of generic interfaces	Implemented
[BSW00330] Usage of macros / inline functions instead of functions	Not applicable (Implementation requirement)
[BSW00331] Separation of error and status values	<a href="#">FIM015</a> , <a href="#">FIM047</a>
[BSW00333] Documentation of callback function context	Not applicable (Documentation requirement)
[BSW00334] Provision of XML file	Not applicable (Implementation requirement)
[BSW00335] Status values naming convention	Implemented
[BSW00336] Shutdown interface	Not applicable (No shutdown interface required for FIM)
[BSW00337] Classification of errors	<a href="#">FIM047</a> , <a href="#">FIM048</a> , <a href="#">FIM049</a>

[BSW04721] Support OBD Functionality	Not applicable (requirement for DEM)
[BSW04722] Return type for API accessed through RTE	<a href="#">FIM011</a>

## 7 Functional specification

## 7.1 Background & Rationale

The Function Inhibition Manager allows querying the permission / inhibition status of software components and the functionality therein. In the FIM context an FID (FID – function identifier) identifies an application functionality along with the inhibit conditions for that particular identifier. The functionalities poll for the permission state of their FID before execution. If an inhibit condition applies for a particular identifier, the corresponding functionality is not allowed to be executed anymore. By means of the FIM, the inhibition of these functionalities can be configured and even modified by calibration. DEM events and their status information are supported as inhibit conditions.

In order to handle the relation of functionality and associated affecting events, the identifier (FID) and inhibit conditions (events) of the functionality are included in the SW component template (equivalence for BSW). During configuration of the FIM, data structures (i.e. an inhibit matrix) are built up to deal with the sensitiveness of the identifiers against certain events.

## 7.2 Requirements

### 7.2.1 FIM core variables

#### 7.2.1.1 Definition of 'Diagnostic Event'

A 'Diagnostic Event' is an identifier provided by the DEM to a specific diagnostic monitor function to report an error. The status of a 'Diagnostic Event' represents the result of a monitoring function or the report of a Basic Software Module.

See AUTOSAR\_SWS\_DEM document for further details [10].

#### 7.2.1.2 Definition of 'Summarized Event'

**[FIM061]** «The FIM configuration shall support summarizing events. A summarized event consists of multiple single diagnostic events.»(BSW04719)

During the configuration process, these single events can be combined to a summarized event ([FIM037\\_Conf](#)). A summarized event simplifies dealing with the multiple events that are associated with or represented by the particular summarized event. For simplicity, this particular summarized event can be used as an inhibit condition in the SW-C templates.

**[FIM064]** «The FIM shall also be able to process the inhibit conditions of all FIDs associated to one summarized event if one of the DEM Events associated to this summarized event is reported to the FIM.»()

Hence, the particular summarized event is just a representative of multiple diagnostic events (ref.10.2.4). A use case for summarized events is for example the combination of all error conditions that indicate a failed sensor:

A sensor X has multiple diagnostics, e.g. short cut ground, battery and open circuit: X\_SCG, X\_SCB and X\_OC. The functions FID\_0, FID\_1, ..., FID\_N are to be inhibited in case of this fault.

A direct configuration requires  $3 * N$  containers `FiMinhibitionConfiguration` with `FIM_INH_EVENT_ID = X_SCG/SCB/OC` and `FIM_INH_FUNCTION_ID = FID_0/.../N`.

With summarized events, a configuration can be created with less effort: A single summarized event is created by a container `FiMSummary`, `FIM_SUMMARIZED_EVENT = X_SUMMARY`. Then three `FiMEventSummary` containers are configured: `FIM_INPUT_SUMMARIZED_EVENT = X_SCG/SCB/OC` and `FIM_OUTPUT_SUMMARIZED_EVENT = X_SUMMARY`. As inhibition only N `FiMinhibitionConfiguration` with `FIM_INH_EVENT_ID = X_SUMMARY` and `FIM_INH_FUNCTION_ID = FID_0/.../N` are needed.

### 7.2.1.3 Definition of 'Function Identifier'

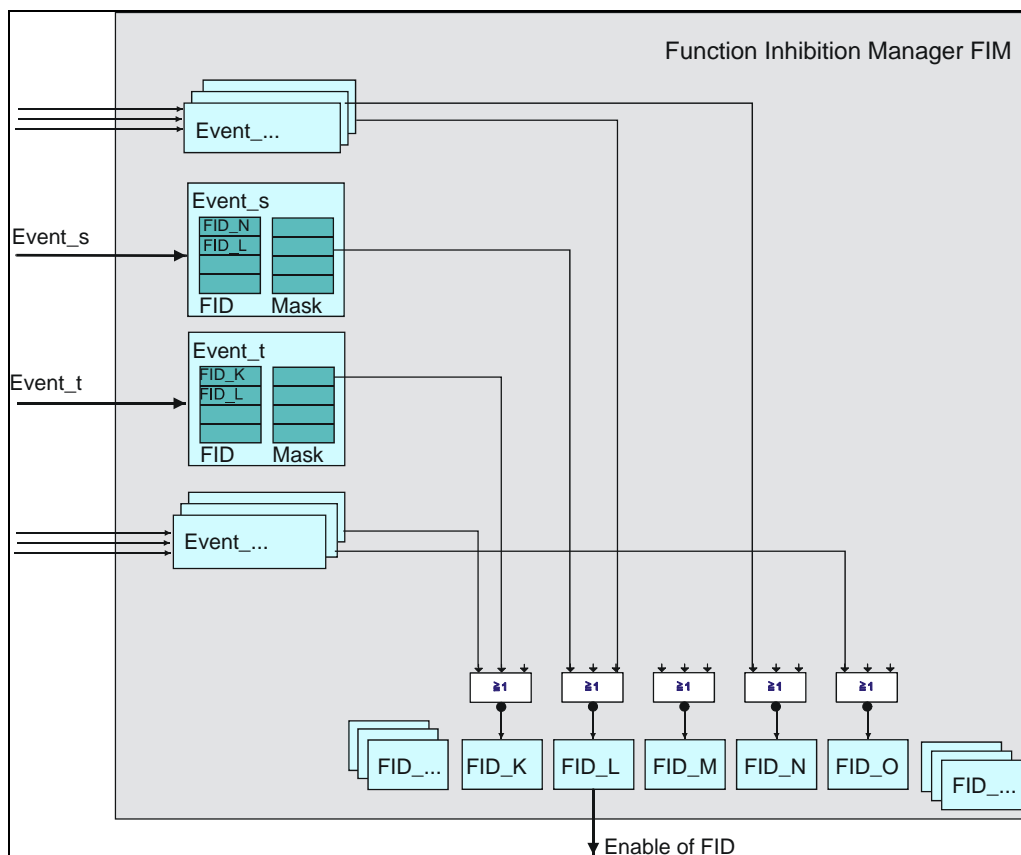

The functionalities are addressed by numbers called function identifiers (FID). A FID represents the contents of one or more parts of runnable entities or BSW functionality with the same set of permission / inhibition conditions.

**[FIM002]** 「The configuration process shall guarantee that FunctionIds are unique per FIM. Two distinct functionalities with different dependencies on events shall never have the same FunctionId (see also [FIM007](#)).」(BSW04701)

**[FIM003]** 「The FIM module's environment shall use the FunctionId to directly point to the associated functionality information (permission status etc.）」(BSW04701)

Note: The SW-C template contains the symbolic names of all FIDs ("FID\_xxx") relevant for the respective SW-C. The subsequent numbering of all FIDs within a node is accomplished by the configuration process.

**[FIM010]** 「The flow of information starts with the API call of the DEM providing changes of the event information. This information is processed and dependencies to FIDs are evaluated. Finally, the permission state of the FIDs is accessed via API through the RTE (Figure 1).」(BSW04700)

**Figure 1: Logical information flow to determine FID permission states for an implementation with permission state stored in RAM**

The permission state of each FID is calculated based on the EventIds assigned to a specific FID. Afterwards, the calculated permission states of each FID (e.g. FID\_K) are “and-ed” to determine the resulting permission state. This implies an implementation where the FIM stores the permission state of the FIDs in RAM.

Alternatively, the FIM can poll the event status to re-calculate the permission state. The polling is triggered either by a functionality requesting its permission state (SW-C or BSW) or in a cyclic task. In this case, there is no increased process effort within the FIM at changes of any event.

#### 7.2.1.4 Definition of ‘Function Identifier permission state’

**[FIM015]** «The FID permission state contains the information whether a functionality represented by its FID can be executed. If the permission state == TRUE, the functionality associated with the FID is permitted to be executed. If the permission state == FALSE, the functionality associated with the FID is not allowed to be executed.»(BSW00331, BSW04713)

The permission state is based on events reported by the DEM. Therefore, the permission state does not directly consider physical conditions (e.g. temperature, engine speed...) but those conditions reported to the DEM (e.g. sensor defect).

Additionally to the permission state as prerequisite, the activity state (is the function active or not) includes physical enable conditions representing whether the functionality is indeed executed or not, i.e. is active or not.

As stated above, one possible implementation is to provide the permission state in status variables. An alternative is to compute the permission on the query based on the underlying dependencies.

Hint: If the permission states are stored in status variables, they are unique values per FID. SW-components access the status via `Fim_GetFunctionPermission`.

**[FIM009]** «If the implementation uses status variables for the permission of the FIDs, the status variables shall be readable for tracking purposes by the calibration system (to be defined by AUTOSAR) during the development phase of the ECU.» (BSW04713)

Note that reliable permission states can only be expected after complete FIM initialization, which follows the DEM initialization. Therefore, reactions on BSW malfunctions via FIM might be delayed.

## 7.2.2 FIM core functionalities

### 7.2.2.1 FIM Data Structure

**[FIM013]** 「The configuration process of the FIM shall create data structures within the FIM module to store the inhibit relations (EventID – FID – applicable mask).」  
(BSW00158, BSW00344, BSW00345, BSW04706)

A configurable number of EventIds and inhibition masks are assigned to one FID. The number of EventIds and inhibit masks per FID have to match so that for each configured event, a corresponding inhibit mask exists.

The inhibition mask contains the inhibition conditions for a FID provided that the associated EventIds have a certain status (`Dem_EventStatusExtendedType`). These masks define which states of an event the FID is sensitive to. However, the mask does not only address certain bits according to the `Dem_EventStatusExtendedType`, it rather selects an algorithm to calculate the boolean inhibition condition from the `Dem_EventStatusExtendedType`.

The implementation of the FIM data structure cannot be prescribed. A possible implementation of the inhibit matrix could be a block of calibration values for each inhibit source (=EventId). That means for each EventId a list of FIDs and masks is available that shall be inhibited by this EventId. A possible FIM structure consisting of such a configuration and a FID status array is exemplarily shown in Figure 2.

There is an inhibition mask assigned to every FID and both are assigned to a particular EventId. If this event has a certain state, the inhibition of the FID becomes active if the event state matches the configured mask.

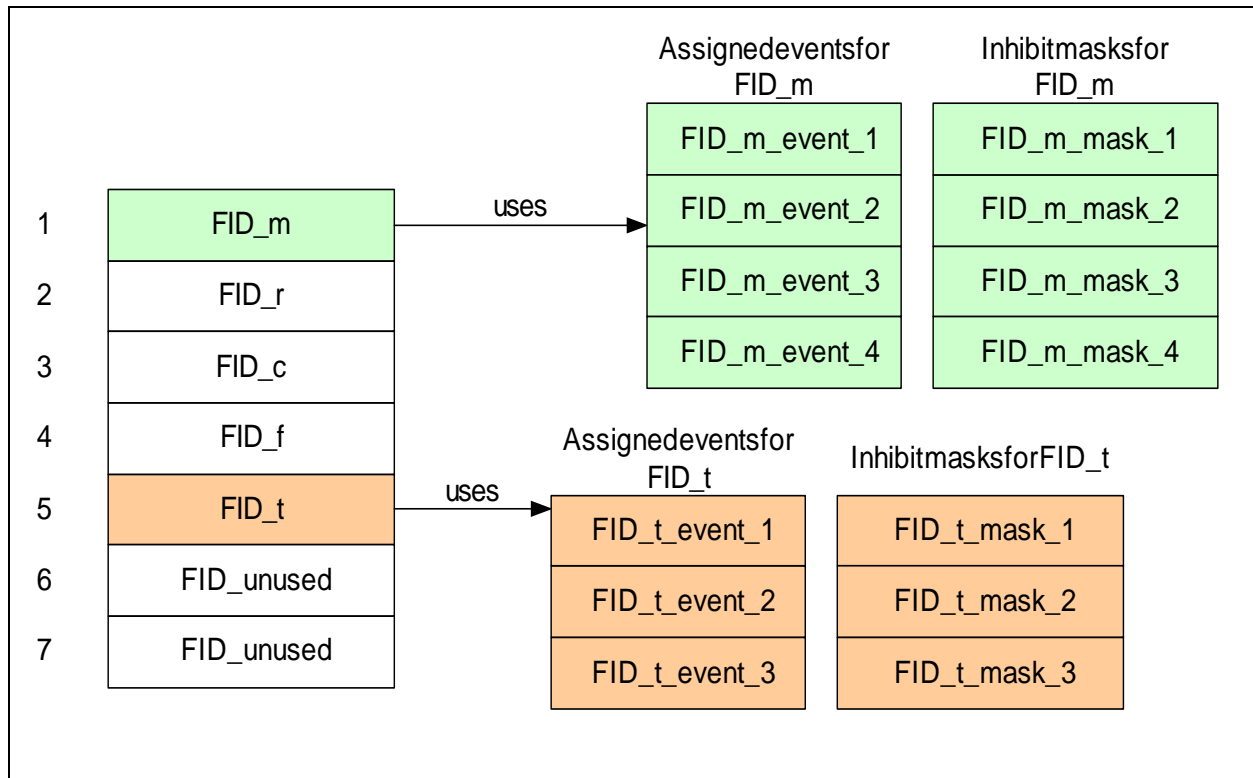

Figure 2: Inhibit mask

**[FIM008]** 「The FIM module shall provide the possibility to modify the inhibit conditions by post-built configuration.」(BSW04706)

Depending on the implementation, it might not be possible to:

- Add new events.
- Extend the number of inhibited FID's per event.
- Extend the specified configuration parameters concerning number of events, number of FIDs and number of links.

### 7.2.2.2 Interaction between DEM and Function Inhibition Manager (FIM)

**[FIM022]** 「The purpose of the FIM module is to provide services to control (permit / inhibit) functionality within SW-Cs based on DEM events being supported as inhibit conditions.」(BSW04717)

**[FIM065]** 「The Function Inhibition Manager shall use the FID – EventIDs – inhibition masks relations provided by the software components to determine the permission state for all configured FIDs.」()

Upon changes of a reported event status, the DEM shall inform the FIM (or other SW-C) about the new status if the FIM is not configured to use polling mode. For this purpose, it shall use the API function `FiM_DemTriggerOnEventStatus`.

Using this API call, the inhibit links assigned to this source can be updated immediately every time an inhibit source changes its status.

1. Note: From the function point of view, synchronous update of inhibit / release conditions can be made either within or outside of `FiM_MainFunction` API.

As mentioned in chapter (4.1), the implementation of the FIM highly depends on requirements (e.g. timing requirements) derived from applications. If an application requires fast reaction times the FIM has to provide FID information sufficiently fast to allow triggering limp-home functionality.

The API `FiM_DemTriggerOnEventStatus` is only relevant if a status variable per FID is stored. In an alternative implementation when no status is stored and the permission status is calculated every time when queried, the API `FiM_DemTriggerOnEventStatus` is without effect.

As an example of implementation, Figure 3 shows the calculation of a single EventId-FID link. On the left hand side, the event status is reported by the DEM as `Dem_EventStatusExtendedType`. This status is compared to the mask configured for the EventId associated with the FID.

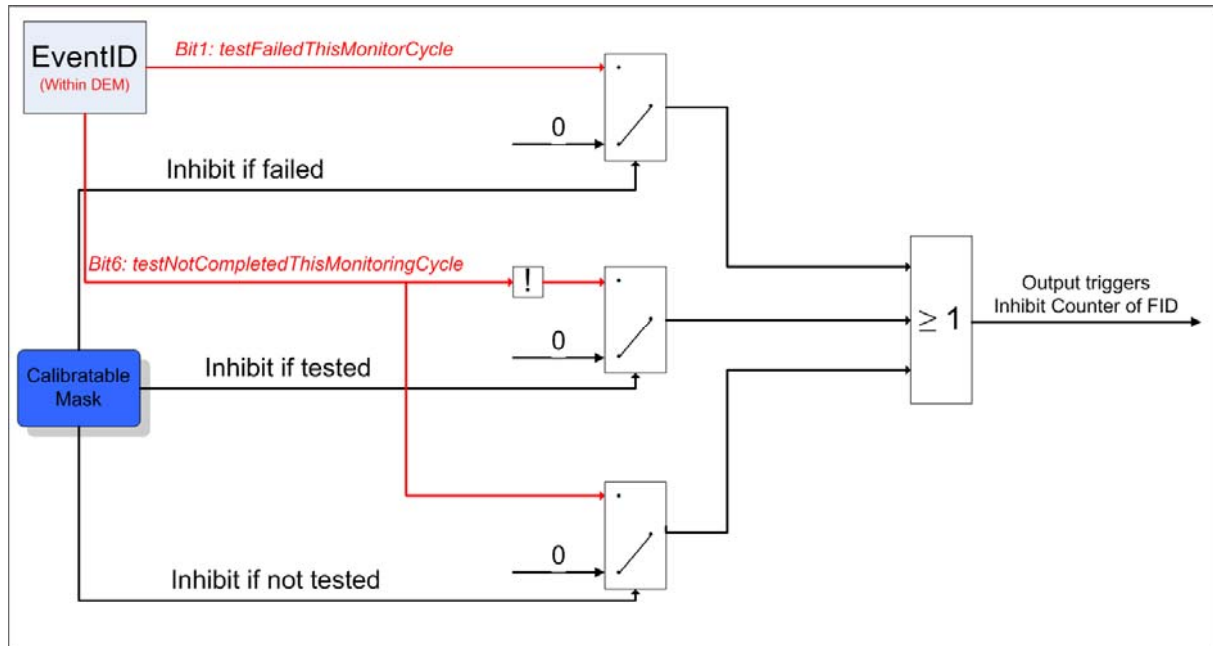

An inhibition counter is assigned to each FID. The inhibition counter contains the number of currently inhibiting EventIds.

If the calculation is performed cyclically (event status is read through `Dem_GetEventStatus`), the inhibition counter shall be incremented if the status and the mask match; otherwise, the inhibition counter is not updated. This is applicable for `FiM_GetFunctionPermission` (if the permission state has to be computed upon the query) and `FiM_MainFunction` APIs.

In the trigger on event status change, the stored currently inhibiting EventIds (inhibition counter) shall be used for the computation for the permission state. If there is an event status change reported by `FiM_DemTriggerOnEventStatus`, then the following shall be performed:

- a. If the change in status for the EventId results in a released state (mask does not match with the event status), then the inhibition counter has to be decremented.
- b. If the change in status for the EventId results in an inhibited state (mask matches with the event status), then the inhibition counter has to be incremented.

If the inhibition counter is  $> 0$ , then the FID permission state shall be set to FALSE, otherwise the FID permission state shall be set to TRUE.

**Figure 3: Calculation of permission state based on event status information**

**[FIM012]** 「The FIM module shall calculate the inhibit status based on the actual status of the inhibit source and the calibrated mask which exists for each inhibit source (ref. 10.2.7). The FIM module shall inhibit the FID if the Event status is equal to the calibrated mask (=Defect, Tested, NotTested). The inhibition is deactivated if the mask of the event does not match anymore the calibrated value.」(BSW04702)

Optionally, the tested status can be used for inhibiting. Depending on the inhibition condition, the inhibition can be active if the event has status "Tested" or "NotTested". If no tested value is selected, the tested status is not relevant.

The available combinations of status flags are assigned to a predefined value which has verbal representation like "Tested", "Not\_Tested" or Last\_Failed".

### 7.2.2.3 Interaction between SW-Components and Function Inhibition Manager (FIM)

**[FIM016]** 「The configuration engineer shall provide at compile time the inhibit conditions for each FID required for handling the dependencies of functionalities and events in the FIM module.」(BSW04706)

Note, that modifications by calibration shall be possible. The configuration mechanism of the FIM using SW-component template contents shall consider these requirements.

First, the FID needs to be introduced and allocated. Furthermore, for each FID a list of events plus associated mask causing the inhibition of the FID shall be provided by the SW-component. Chapter 10 introduces how the SW-component template considers these configuration requirements.

During the configuration process, the data structures are built up. Depending on the implementation this could, e.g. be a mapping of an event onto all affected FIDs or alternatively vice versa, a mapping of a FID onto all events affecting it.

Controlling implies that within the implemented functionality, the permission of a FID is queried via AUTOSAR service.

**[FIM020]** «The FIM module shall ensure an immediate control of functionality by synchronously responding to an incoming permission query. The FIM module shall realize this behavior either by storing the permission state as a status variable or by evaluation of the event states upon permission query.»(BSW04713)

#### 7.2.2.4 Application example for FIM usage

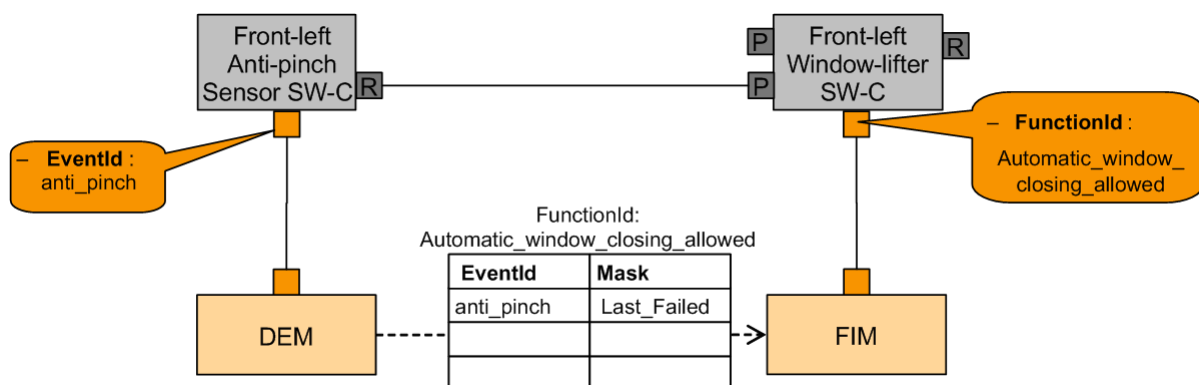

Figure 4: FIM usage

- The configuration of the FIM actually establishes the relationship between the EventId and the assigned FunctionId(s)
- The required information is:
  - For each FunctionId: How does the status of the FunctionId depend on the status of one/several EventIds?
    - The mask determines the relationship between the EventId status and the inhibit status of the FunctionId.
    - The row result is 'OR'ed to come up with the overall result for one FunctionId if it depends on several EventIds.

### 7.2.2.5 Initialization

**[FIM018]** If DEM events status information is used, the FIM module shall compute the permission states for all FIDs at its initialization based on all restored event status information (not only events stored in the fault memory) of the DEM. (BSW00416, BSW04712)

Hence, the FIM needs to be initialized after the DEM.

If FIM and DEM are delivered as one bundle, the FIM may have direct access to event information (structure) in the DEM rather than using the API `Dem_GetEventStatus`. In this way, a time-efficient initialization of the FIM can be achieved.

## 7.2.3 OBD-Functionality

### 7.2.3.1 In-Use-Monitor Performance Ratio (IUMPR) Support

In order to track the behavior of diagnostic functions in every day usage, in particular the capability to find malfunctions, the regulations require the tracking of this performance in relation to a standardized driving profile. This is called “In-Use Monitor Performance Ratio” (IUMPR) defined as the number of times a fault could have been found (=numerator) divided by the number of times the standardized driving profile has been fulfilled (=denominator). The relevant data recording is allocated in the DEM based on FIDs and EventIDs.

Thus, based on the FIM configuration of the referenced FIDs it can be evaluated whether a Ratio Id specific data record needs to be stopped. In particular, IUMPR tracking shall be stopped as long as the entry remains visible in service \$07.

The DEM may use the FIM configuration for its IUMPR calculation or by call of `Fim_GetFunctionPermission` of a dedicated FID.

Note: The FIM does not provide special OBDII functionality but uses already existing mechanisms for OBDII.

## 7.2.4 Auxiliary explanations and definitions

### 7.2.4.1 Output for other WPs

In order to be runtime-efficient, the event status information needs to be evaluated quickly, e.g. in the `Fim_Init` function. If DEM and FIM are implemented as one package, the DEM-APIs with access to event status information are not necessarily used and so direct access to event status information is allowed (see AUTOSAR conformance classes).

### 7.2.5 Version check

**[FIM023]** 「The FIM module shall perform Inter Module Checks to avoid integration of incompatible files.

The imported included files shall be checked by preprocessing directives. 」  
(BSW00003, BSW00004)

The following version numbers shall be verified:

- <MODULENAME>\_AR\_RELEASE\_MAJOR\_VERSION
- <MODULENAME>\_AR\_RELEASE\_MINOR\_VERSION

Where <MODULENAME> is the module short name of the other (external) modules which provide header files included by the FIM module.

If the values are not identical to the expected values, an error shall be reported.

### 7.3 Error classification

The FIM checks for certain faults during development and integration phase.

**[FIM047]** 「Development error values are of type uint8.」(BSW00327, BSW00331, BSW00337)

**[FIM076]** 「The FIM module shall detect the following errors and exceptions depending on its configuration (development/production): 」()

<i>Type or error</i>	<i>Relevance</i>	<i>Related error code</i>	<i>Value [hex]</i>
FiM_GetFunctionPermission is called by the application (SW-C) before complete initialization	Development	FIM_E_WRONG_PERMISSION_REQ	0x01
DEM calls FIM before the FIM is initialized	Development	FIM_E_WRONG_TRIGGER_ON_EVENT	0x02
FiM_GetFunctionPermission called with wrong FID	Development	FIM_E_FID_OUT_OF_RANGE	0x03
API is invoked with NULL Pointer	Development	FIM_E_INVALID_POINTER	0x05
DEM calls FIM with wrong Dem_EventStatusExtendedType	Development	FIM_E_INVALID_EVENTSTATUSEXTENDEDTYPE	0x06

## 7.4 Error detection

**[FIM048]** 「The detection of development errors within the FIM module shall be configurable (ON/OFF) at pre-compile time. The switch `FIM_DEV_ERROR_DETECT` (see chapter 10) shall activate or deactivate the detection of all development errors.」(BSW00337)

**[FIM049]** 「If the `FIM_DEV_ERROR_DETECT` switch is enabled, API parameter checking within the FIM module is enabled. The detailed description of the detected errors can be found in chapter 7.3.」(BSW00337)

## 7.5 Error notification

**[FIM051]** 「The FIM module shall report detected development errors to the error hook of the Development Error Tracer (DET) if the pre-processor switch `FIM_DEV_ERROR_DETECT` is set (see chapter 10). 」 (BSW00338, BSW00369, BSW00385)

## 7.6 Debugging

**[FIM085]** 「Each variable that shall be accessible by AUTOSAR Debugging, shall be defined as global variable.」()

**[FIM086]** 「All type definitions of variables which shall be debugged, shall be accessible by the header file FiM.h.」()

**[FIM087]** 「The declaration of variables in the header file shall be such that it is possible to calculate the size of the variables by C-"sizeof".」()

**[FIM088]** 「Variables available for debugging shall be described in the respective Basic Software Module Description.」()

## 8 API specification

## 8.1 Imported types

In this chapter, all types included from the following files are listed:

[FIM081] ⌈

<b>Module</b>	<b>Imported Type</b>
Dem	Dem_EventIdType
	Dem_EventStatusExtendedType
SchM	SchM_ReturnType
Std_Types	Std_ReturnType
	Std_VersionInfoType

⌋()

## 8.2 Type definitions

### 8.2.1 FiM\_FunctionIdType

[FIM027] ⌈

<b>Name:</b>	FiM_FunctionIdType		
<b>Type:</b>	uint8, uint16		
<b>Range:</b>	0..255, 0..65535	-	Identifier of functionality - Configurable, size depends on System complexity. Remark: Not all numbers are valid. The FIM data generation tool shall only assign valid values.
<b>Description:</b>	Type for the FunctionID		

⌋(BSW00304, BSW00305, BSW00377)

### 8.2.2 FiM\_ConfigType

[FIM092] ⌈

<b>Name:</b>	FiM_ConfigType		
<b>Type:</b>	Structure		
<b>Range:</b>	--		implementation specific
<b>Description:</b>	This type defines a data structure for the post build parameters of the FIM. At initialization the FIM gets a pointer to a structure of this type to get access to its configuration data, which is necessary for initialization.		

⌋()

## 8.3 Function definitions

This is a list of functions provided for upper layer modules.

### 8.3.1 Interface ECU State Manager ↔ FIM

#### 8.3.1.1 FiM\_Init

[FIM077] ⌈

<b>Service name:</b>	FiM_Init
<b>Syntax:</b>	void FiM_Init( const FiM_ConfigType* FiMConfigPtr )
<b>Service ID[hex]:</b>	0x00
<b>Sync/Async:</b>	Synchronous
<b>Reentrancy:</b>	Non Reentrant
<b>Parameters (in):</b>	FiMConfigPtr --
<b>Parameters (inout):</b>	None
<b>Parameters (out):</b>	None
<b>Return value:</b>	None
<b>Description:</b>	This service initializes the FIM.

⌋()

The ECU State Manager shall call the function `FiM_Init` during the startup phase of the ECU in order to initialize the permission states of the FIDs based on the event data of the DEM.

The FIM is not functional until this function has been called.

**[FIM004]** 「The FIM calculates the permission states based on event status information stored in the DEM and inhibition mask configuration.」(BSW00101, BSW00166, BSW00310, BSW00358, BSW00384, BSW00414, BSW00416, BSW04712)

Therefore, the DEM must be initialized before the FIM. SW-Components controlled by FID interface are initialized afterwards.

**[FIM071]** 「The FIM module's environment shall make sure that the DEM has been initialized before the FIM is initialized.」()

**[FIM045]** 「If development error detection is turned on the FIM module shall report an error to the DET if it has not successfully completed the initialization and has detected not permitted access.」(BSW00358, BSW00406)

**[FIM059]** 「A static status variable denoting if the FIM is initialized shall be initialized with value 0 before any APIs of the FIM is called.

`Fim_Init` shall set the static status variable to a value not equal to 0.」(BSW00358, BSW00406)

In order to restore the permission states quickly, it is recommended that the DEM provides direct access to event status information if DEM and FIM are implemented as a cluster. In this case, the FIM needs to have knowledge about the data structure of the DEM so that it can directly access EventId states.

**[FIM072]** 「If DEM and FIM are implemented as two separate modules, the FIM module shall access the EventId states through the API call `Dem_GetEventStatus`.」()

**Note:** There is no explicit action during shutdown. The permission states remain valid until the ECU is shut down since they directly depend on the event status information.

## 8.3.2 Interface SW-Components ⇔ FIM

### 8.3.2.1 FiM\_GetFunctionPermission

[FIM011] ⌈

<b>Service name:</b>	FiM_GetFunctionPermission	
<b>Syntax:</b>	<pre>Std_ReturnType FiM_GetFunctionPermission(     FiM_FunctionIdType FID,     boolean* Permission )</pre>	
<b>Service ID[hex]:</b>	0x01	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Reentrant	
<b>Parameters (in):</b>	FID	Identification of a functionality by assigned FID. The FunctionId is configured in the FIM.  Min.: 1 (0: Indication of no functionality) Max.: Result of configuration of FIDs in FIM (Max is either 255 or 65535)
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	Permission	TRUE: FID has permission to run FALSE: FID has no permission to run, i.e. shall not be executed
<b>Return value:</b>	Std_ReturnType	E_OK: The request is accepted E_NOT_OK: The request is not accepted, ie. initialization of FIM not completed
<b>Description:</b>	This service reports the permission state to the functionality.	

⌋(BSW00166, BSW00310, BSW00312, BSW04700, BSW04709, BSW04722)

[FIM066] ⌈ The SW Components and the BSW shall use the function `FiM_GetFunctionPermission` to query for the permission to execute a certain functionality represented by the respective FID.⌋()

[FIM025] ⌈The function `FiM_GetFunctionPermission` shall deliver the return value synchronously to enable direct use of this information for controlling and executing the underlying code in the software component.⌋()

[FIM055] ⌈If development error detection for the module FIM is enabled: the function `FiM_GetFunctionPermission` shall perform a plausibility check on the FID range. If a FID is out of range, the function shall raise a development error and return no permission (FALSE).⌋(BSW00406)

[FIM056] ⌈If development error detection for the module FIM is enabled: the function `FiM_GetFunctionPermission` shall check that the initialization of the module FIM has been completed. If the function detects that the initialization is not complete, it shall raise a development error and return no permission (FALSE).⌋(BSW00406)

### 8.3.3 Interface DEM ↔ FIM

#### 8.3.3.1 FiM\_DemTriggerOnEventStatus

[FIM021]「

<b>Service name:</b>	FiM_DemTriggerOnEventStatus	
<b>Syntax:</b>	<pre>void FiM_DemTriggerOnEventStatus(     Dem_EventIdType EventId,     uint8 EventStatusOld,     uint8 EventStatusNew )</pre>	
<b>Service ID[hex]:</b>	0x02	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Reentrant	
<b>Parameters (in):</b>	EventId	Identification of an Event by assigned event number. The Event Number is configured in the DEM. Min.: 1 (0: Indication of no Event or Failure) Max.: Result of configuration of Event Numbers in DEM (Max is either 255 or 65535)
	EventStatusOld	Extended event status before change
	EventStatusNew	Detected / reported of event status
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	None	
<b>Description:</b>	This service is provided by the Dem in order to call FiM upon status changes.	

」(BSW00166, BSW00310, BSW00312, BSW04717)

**[FIM073]**「If the FIM module is notified by DEM about event status changes (as defined in configuration parameter FIM\_EVENT\_UPDATE\_TRIGGERED\_BY\_DEM = TRUE), the DEM module shall call the function FiM\_DemTriggerOnEventStatus whenever the status of an event changes.」()

In case, the FIM module polls event status (as defined in configuration parameter FIM\_EVENT\_UPDATE\_TRIGGERED\_BY\_DEM = FALSE), the FIM has to query event status information from the DEM. In that case, the DEM does not have to call the function FiM\_DemTriggerOnEventStatus. FIM module can decide whether to poll all event status in a cyclic manner, or one by one upon a call to FiM\_GetFunctionPermission.

**[FIM057]**「If development error detection for the module FIM is enabled: the function FiM\_DemTriggerOnEventStatus shall perform a plausibility check on the EventId. If an EventId is out of range, the function shall raise a development error.」  
(BSW00406)

**[FIM058]** ⌈If development error detection for the module FIM is enabled: The function `FiM_DemTriggerOnEventStatus` shall check for complete initialization of the FIM. If the function detects that the initialization is not complete, it shall raise a development error.⌋(BSW00406)

### 8.3.3.2 FiM\_DemInit

**[FIM006]** ⌈

<b>Service name:</b>	FiM_DemInit
<b>Syntax:</b>	void FiM_DemInit( void )
<b>Service ID[hex]:</b>	0x03
<b>Sync/Async:</b>	Synchronous
<b>Reentrancy:</b>	Non Reentrant
<b>Parameters (in):</b>	None
<b>Parameters (inout):</b>	None
<b>Parameters (out):</b>	None
<b>Return value:</b>	None
<b>Description:</b>	This service re-initializes the FIM.

⌋(BSW00101, BSW00166, BSW00310, BSW00358)

**[FIM068]** ⌈The DEM shall call `FiM_DemInit` to re-initialize the FIM module in case the DEM detects a status change of a certain number of events (DEM implementation specific), e.g. clearance of event memory in the DEM (on service 04/ISO15031-5 request).⌋()

**[FIM069]** ⌈The function `FiM_DemInit` shall re-compute the permission state for all FIDs.⌋()

**[FIM082]** ⌈If DEM and FIM are implemented as two separate modules, the function `FiM_DemInit` shall synchronously access the `EventId` states via the function `Dem_GetEventStatus`.⌋()

In case DEM and FIM are implemented as one bundle, the FIM module needs to have knowledge about the data structure of the DEM so that it can directly access the `EventId` states.

### 8.3.4 FiM\_GetVersionInfo

**[FIM078]** ⌈

<b>Service name:</b>	FiM_GetVersionInfo
<b>Syntax:</b>	void FiM_GetVersionInfo( Std_VersionInfoType* versioninfo )
<b>Service ID[hex]:</b>	0x04
<b>Sync/Async:</b>	Synchronous
<b>Reentrancy:</b>	Reentrant
<b>Parameters (in):</b>	None
<b>Parameters (inout):</b>	None
<b>Parameters (out):</b>	versioninfo   Pointer to where to store the version information of this module.
<b>Return value:</b>	None
<b>Description:</b>	This service returns the version information of this module.

⌋()

**[FIM032]** ⌈The function `FiM_GetVersionInfo` shall return the version information of the FIM module. The version information includes:

- Module Id
- Vendor Id
- Vendor specific version numbers (BSW00407).⌋(BSW00171, BSW00379, BSW00407, BSW00411)

**[FIM033]** ⌈The function `FiM_GetVersionInfo` shall be pre-compile time configurable On/Off by the configuration parameter `FIM_VERSION_INFO_API`.⌋(BSW00171, BSW00379, BSW00407, BSW00411)

**[FIM074]** ⌈If source code for caller and callee of the function `FiM_GetVersionInfo` is available, the module FIM should realize this function as a macro, defined in the module's header file.⌋()

## 8.4 Call-back notifications

This chapter lists all functions provided by the FIM module and used by lower layer modules.

No callback notification is specified.

## 8.5 Scheduled functions

This chapter lists all functions provided by the FIM module and called directly by the Basic Software Module Scheduler.

### 8.5.1 FiM\_MainFunction

#### [FIM060] ⌈

<b>Service name:</b>	FiM_MainFunction
<b>Syntax:</b>	void FiM_MainFunction( void )
<b>Service ID[hex]:</b>	0x05
<b>Timing:</b>	FIXED_CYCLIC
<b>Description:</b>	--

⌋(BSW00373, BSW00376)

The evaluation of permission states can be performed either on event change or cyclically.

**[FIM070]** ⌈If FIM module polls event status (as defined in configuration parameter `FIM_EVENT_UPDATE_TRIGGERED_BY_DEM = FALSE`) and decides to do it in a cyclic manner, `FiM_MainFunction` shall be used to calculate the permission states of all EventIds using their inhibition masks. The API `Dem_GetEventStatus` shall be used to get status information of EventIds.⌋()

**[FIM067]** ⌈The FIM shall perform the evaluation of actual EventIds status information cyclically for all the EventIds using the inhibition mask and then calculate the corresponding FID permission states. FIM shall access the event status information using the API `Dem_GetEventStatus` if DEM and FIM are implemented as separate modules. FIM shall access the event status structure of DEM if DEM and FIM are implemented as a bundle.⌋()

## 8.6 Expected Interfaces

This chapter lists all functions the module FIM requires from other modules.

### 8.6.1 Mandatory Interfaces

This chapter defines all interfaces, which are required to fulfill the core functionality of the module.

#### [FIM079] ⌈

API function	Description
Dem_GetEventStatus	Gets the current extended event status of an event.
SchM_ActMainFunction_FiM	Invokes the SchM_ActMainFunction function to trigger the activation of a corresponding main processing function.
SchM_CancelMainFunction_FiM	Invokes the SchM_CancelMainFunction function to trigger the cancellation of the requested activation of a corresponding main processing function.

⌋()

### 8.6.2 Optional Interfaces

This chapter defines all interfaces, which are required to fulfill an optional functionality of the module.

#### [FIM080] ⌈

API function	Description
Det_ReportError	Service to report development errors.

⌋()

### 8.6.3 Configurable interfaces

#### 8.6.3.1 FunctionInhibition

A client can query the FIM for execution permission for a specific function. Functions are represented in the FIM by FunctionIds (FIDs). These FIDs are not directly used by the client SW-C. Instead, the mechanism of “port-defined argument values” is used and every FID is mapped to a separate port that is responsible for the data exchange via RTE.

Using the concepts of the SW-C template, the interface is defined as follows:

```
[FIM090] ⌈ClientServerInterface FunctionInhibition {
    GetFunctionPermission(OUT ImplementationDataType Permission);
}
```

The following pseudo-code shows an example definition of the FIM.

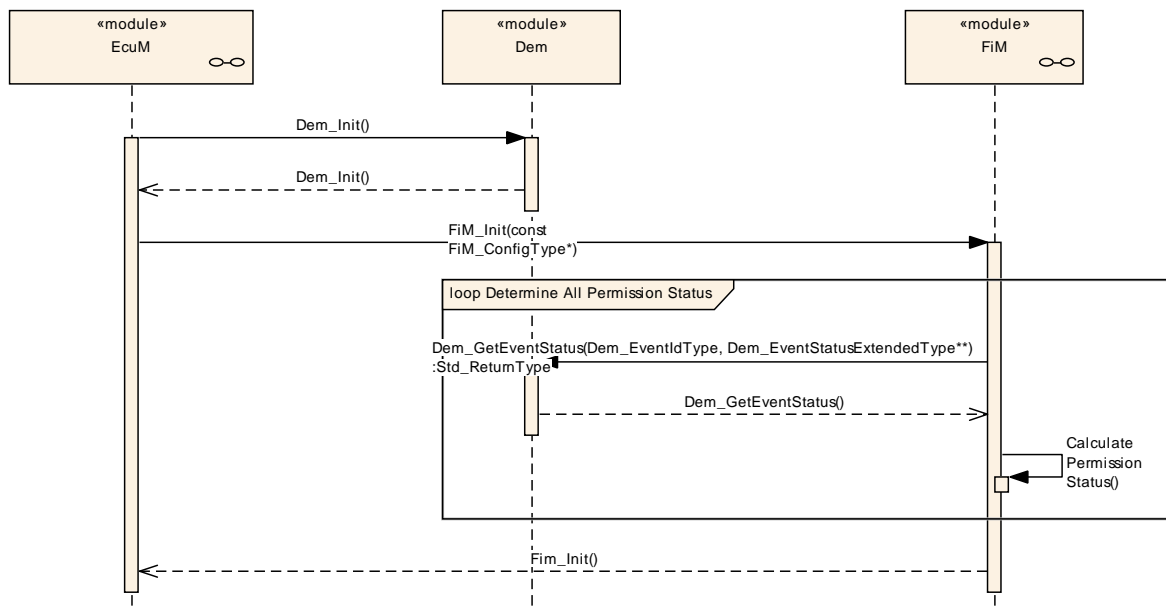

```
Service FiM {  
    ProvidePort FunctionInhibition Func1;  
    ProvidePort FunctionInhibition Func2;  
    ProvidePort FunctionInhibition Func3;  
  
}  
J()
```

## 9 Sequence diagrams

## 9.1 Initialization sequence of FIM

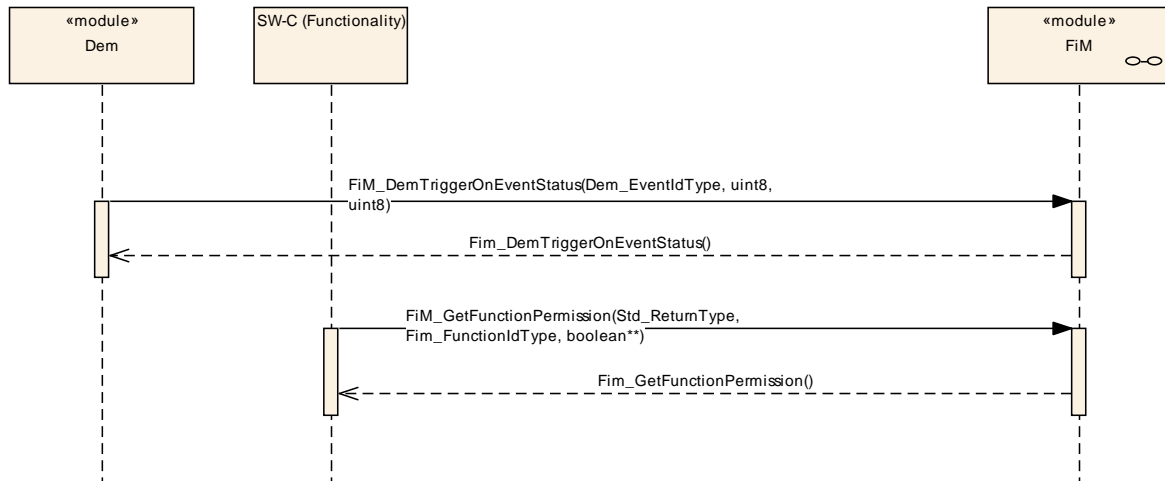

`Dem_Init` is called by the ECU State Manager as soon as the NVRAM Manager has copied the error memory relevant data block(s) from NVRAM to RAM ([10], DEM065). After the initialization of the DEM, the ECU State Manager is able to call `FiM_Init` and the FIM is able to calculate the permission states of all FIDs based on the event status information afterwards. The FIM loops over all configured FIDs and reads the event status information by calling `Dem_GetEventStatus`.

**[FIM075]** If the copying process of NVRAM data has not been successful, the ECU State Manager shall not call `Dem_Init` and `FiM_Init`.()

## 9.2 FiM\_DemTriggerOnEventStatus

The sequence diagram below illustrates how the DEM informs the FiM about the change of a certain event status by calling `FiM_DemTriggerOnEventStatus`. Furthermore, it indicates how the FiM is affected by requesting permission status using `FiM_GetFunctionPermission`.

## 10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification, Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module FIM.

Chapter 10.3 specifies published information of the module FIM.

## 10.1 How to read this chapter

In addition to this section, it is highly recommended to read the documents:

- AUTOSAR Layered Software Architecture [2]
- AUTOSAR ECU Configuration Specification [5]  
This document describes the AUTOSAR configuration methodology and the AUTOSAR configuration meta-model in detail.

The following is only a short survey of the topic and it will not replace the ECU Configuration Specification document.

### 10.1.1 Configuration and configuration parameters

Configuration parameters define the variability of the generic part(s) of an implementation of a module. This means that only generic or configurable module implementation can be adapted to the environment (software/hardware) in use during system and/or ECU configuration.

The configuration of parameters can be achieved at different times during the software process: before compile time, before link time or after build time. In the following, the term “configuration class” (of a parameter) shall be used in order to refer to a specific configuration point in time.

## 10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters are described in Chapter 7 and Chapter 7.3.

[FIM062] ⌈

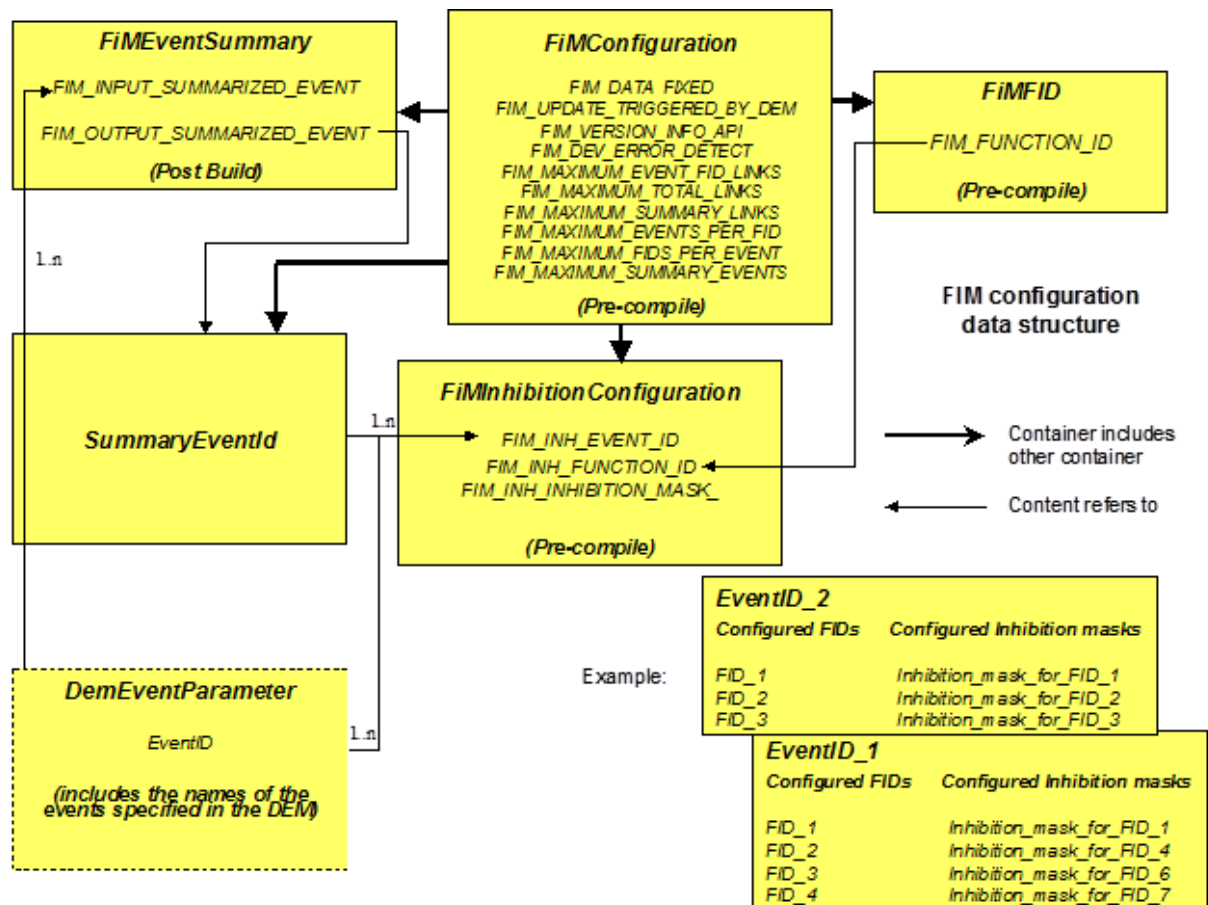

Figure 5: FIM configuration ⌋(BSW00404, BSW00405)

### 10.2.1 Variants

Variants describe sets of configuration parameters. Thus describe the possible configuration variants of this module

[FIM089] ⌈VARIANT-PRE-COMPILE: Only parameters with "Pre-compile time" configuration are allowed in this variant. ⌋()

**[FIM091]** 「VARIANT-POST-BUILD: Parameters with "Pre-compile time", "Link time" and "Post-build time" are allowed in this variant.」()

The inhibit conditions provided by the software components can be considered as a superset of all inhibit conditions for all variants. Based on that, the inhibit configuration has to be derived for all events and FIDs in one project. If an EventId or FID is not supported in a certain variant, the link between them has no effect. The requirements BSW00404 and BSW00405 are therefore not applicable.

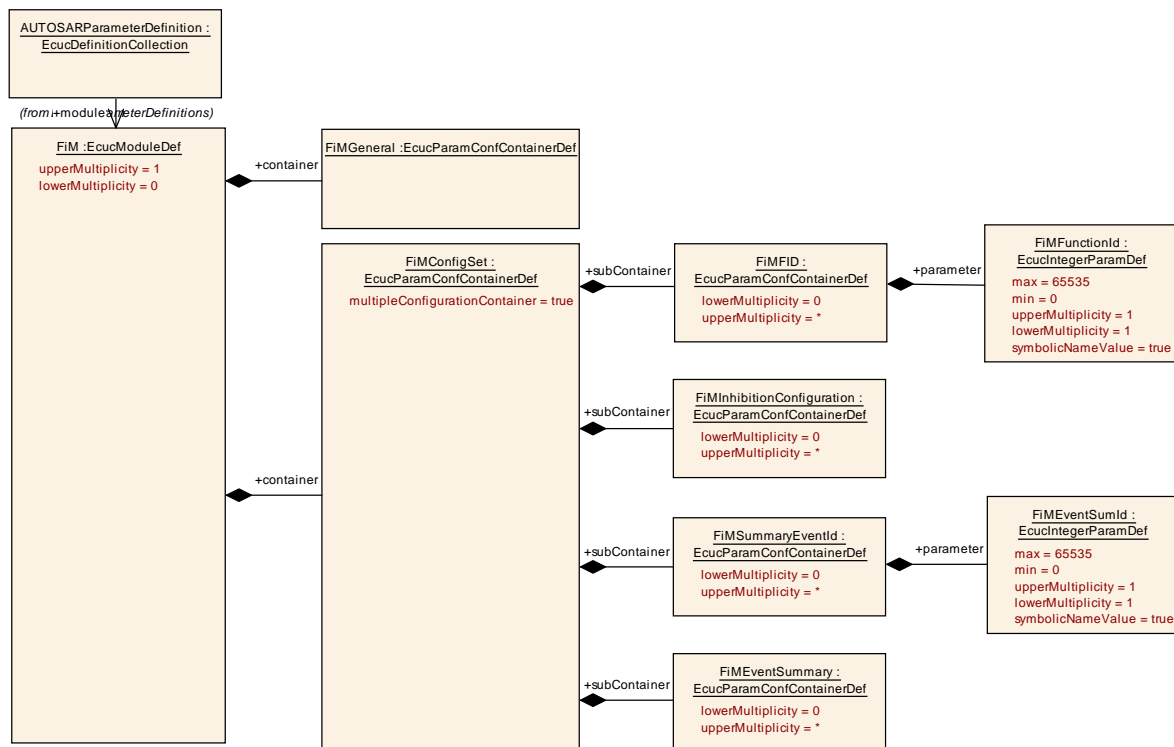

Figure 6: Configuration overview for FIM

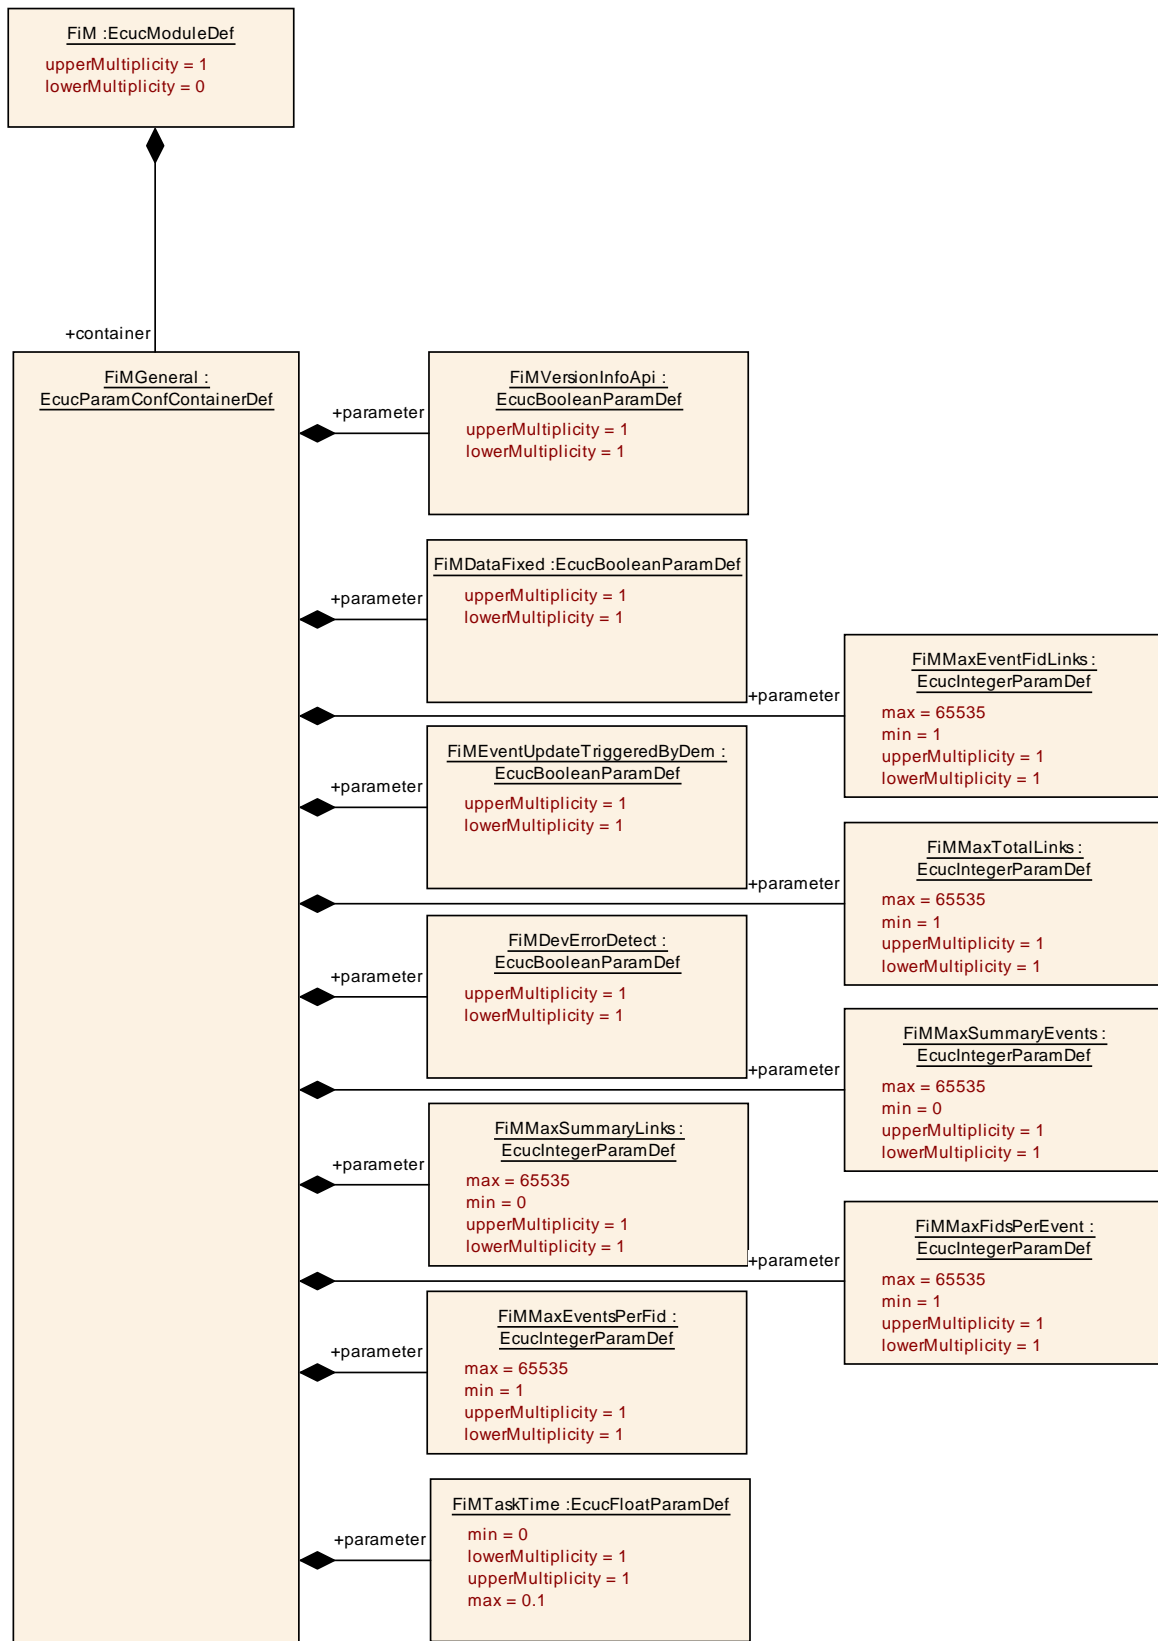

Figure 7: Configuration overview for FiMGeneral

## 10.2.2 FiM

<b>Module Name</b>	<i>FiM</i>
<b>Module Description</b>	Configuration of the FiM (Function Inhibition Manager) module.

<b>Included Containers</b>		
<b>Container Name</b>	<b>Multiplicity</b>	<b>Scope / Dependency</b>
FiMConfigSet	1	This container contains the configuration parameters and sub containers of the FiM module supporting multiple configuration sets. This container is a MultipleConfigurationContainer, i.e. this container and its sub-containers exist once per configuration set.
FiMGeneral	1	--

## 10.2.3 FiMGeneral

<b>SWS Item</b>	<b>FIM040_Conf :</b>
<b>Container Name</b>	FiMGeneral
<b>Description</b>	--
<b>Configuration Parameters</b>	

<b>SWS Item</b>	<b>FIM008_Conf :</b>		
<b>Name</b>	FiMDataFixed {FIM_DATA_FIXED}		
<b>Description</b>	Enable or disable calibration of inhibit relations The scope of the parameter is to meet the requirement (FIM008) to have the option to calibrate inhibit data on the one hand side and also to provide the option to protect inhibit data for consistency reasons.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM087_Conf :</b>		
<b>Name</b>	FiMDevErrorDetect {FIM_DEV_ERROR_DETECT}		
<b>Description</b>	This configuration parameter is used to switch on or to switch off the detection of development errors during development.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM086_Conf :</b>		
<b>Name</b>	FiMEventUpdateTriggeredByDem {FIM_EVENT_UPDATE_TRIGGERED_BY_DEM}		
<b>Description</b>	This configuration parameter specifies the way FIM obtains status of EventIds. TRUE: the DEM informs FIM about changes of event status,		

	FALSE: the FIM polls event status from the DEM module either cyclically or on demand.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM088_Conf :</b>		
<b>Name</b>	FiMMaxEventFidLinks {FIM_MAXIMUM_EVENT_FID_LINKS}		
<b>Description</b>	This configuration parameter specifies the total maximum number of links between EventIds and FIDs.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef		
<b>Range</b>	1 .. 65535		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM089_Conf :</b>		
<b>Name</b>	FiMMaxEventsPerFid {FIM_MAXIMUM_EVENTS_PER_FID}		
<b>Description</b>	This configuration parameter specifies the maximum number of EventIds that can be linked to a single FID.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef		
<b>Range</b>	1 .. 65535		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM090_Conf :</b>		
<b>Name</b>	FiMMaxFidsPerEvent {FIM_MAXIMUM_FIDS_PER_EVENT}		
<b>Description</b>	This configuration parameter specifies the maximum number of FIDs that can be linked to a single event.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef		
<b>Range</b>	1 .. 65535		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM091_Conf :</b>		
<b>Name</b>	FiMMaxSummaryEvents {FIM_MAXIMUM_SUMMARY_EVENTS}		
<b>Description</b>	This configuration parameter specifies the maximum number of summarized events that can be configured.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef		

<b>Range</b>	0 .. 65535		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM092_Conf :</b>		
<b>Name</b>	FiMMaxSummaryLinks {FIM_MAXIMUM_SUMMARY_LINKS}		
<b>Description</b>	This configuration parameter specifies the total maximum number of links between EventIds and summarized events.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef		
<b>Range</b>	0 .. 65535		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM093_Conf :</b>		
<b>Name</b>	FiMMaxTotalLinks {FIM_MAXIMUM_TOTAL_LINKS}		
<b>Description</b>	This configuration parameter specifies the total maximum number of links between EventIds and FIDs plus the number of links between EventIds and summarized events.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef		
<b>Range</b>	1 .. 65535		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM600_Conf :</b>		
<b>Name</b>	FiMTaskTime {FIM_TASK_TIME}		
<b>Description</b>	Allow to configure the time for the periodic cyclic task. Please note: This configuration value shall be equal to the value in the Basic Software Scheduler configuration of the RTE module. The AUTOSAR configuration standard is to use SI units, so this parameter is defined as float value in seconds. DEM configuration tools must convert this float value to the appropriate value format for the use in the software implementation of DEM. min: A negative value is not allowed. max: FID must be set after a maximal time of 100ms after DEM status is set. upperMultiplicity: Exactly one TaskTime must be specified per configuration. lowerMultiplicity: Exactly one TaskTime must be specified per configuration.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucFloatParamDef		
<b>Range</b>	0 .. 0.1		
<b>Default value</b>	--

## 10.2.4 FiMConfigSet

<b>SWS Item</b>	<b>FIM601_Conf :</b>
<b>Container Name</b>	FiMConfigSet [Multi Config Container]
<b>Description</b>	This container contains the configuration parameters and sub containers of the FiM module supporting multiple configuration sets. This container is a MultipleConfigurationContainer, i.e. this container and its sub-containers exist once per configuration set.
<b>Configuration Parameters</b>	

<b>Included Containers</b>		
<b>Container Name</b>	<b>Multiplicity</b>	<b>Scope / Dependency</b>
FiMEventSummary	0..*	The summarized EventId definition record consists of a summarized event ID and a specific EventId. This record means that a particular FID that has to be disabled in case of summarized event (defined above) is to be disabled in any of the specific events. A possible solution could be assigning events as summarized events along with a list of specific events. During the configuration process the summarized event substitutes the referenced single events. However, it is not outlined how this requirement is solved - whether by configuration process or by implementation within the FiM. The FiM configuration tool could also build up a suitable data structure for summarized events and deal with it in the FiM implementation.
FiMFID	0..*	This container includes symbolic names of all FIDs.
FiMinhibitionConfiguration	0..*	This container includes all configuration parameters concerning the relationship between event and FID.
FiMSummaryEventId	0..*	This container defines the name of a summarized event.

## 10.2.5 FiMFID

<b>SWS Item</b>	<b>FIM039_Conf :</b>
<b>Container Name</b>	FiMFID{FiMFID}
<b>Description</b>	This container includes symbolic names of all FIDs.
<b>Configuration Parameters</b>	

<b>SWS Item</b>	<b>FIM085_Conf :</b>		
<b>Name</b>	FiMFunctionId {FIM_FUNCTION_ID}		
<b>Description</b>	The configuration parameter is used as an ID which represents a functionality. FiMFunctionId is the unique identifier assigned during FIM configuration. Implementation Type: FiM_FunctionIdType.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
<b>Range</b>	0 .. 65535		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

No Included Containers

### 10.2.6 FiMEventSummary

<b>SWS Item</b>	<b>FIM037_Conf :</b>
<b>Container Name</b>	FiMEventSummary
<b>Description</b>	<p>The summarized EventId definition record consists of a summarized event ID and a specific EventId.</p> <p>This record means that a particular FID that has to be disabled in case of summarized event (defined above) is to be disabled in any of the specific events. A possible solution could be assigning events as summarized events along with a list of specific events. During the configuration process the summarized event substitutes the referenced single events.</p> <p>However, it is not outlined how this requirement is solved - whether by configuration process or by implementation within the FiM. The FiM configuration tool could also build up a suitable data structure for summarized events and deal with it in the FiM implementation.</p>
<b>Configuration Parameters</b>	

<b>SWS Item</b>	<b>FIM083_Conf :</b>		
<b>Name</b>	FiMInputSumEventRef {FIM_INPUT_SUMMARIZED_EVENT}		
<b>Description</b>	--		
<b>Multiplicity</b>	1..*		
<b>Type</b>	Reference to [ DemEventParameter ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	VARIANT-PRE-COMPILE
	<b>Link time</b>	--	
	<b>Post-build time</b>	X	VARIANT-POST-BUILD
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM084_Conf :</b>		
<b>Name</b>	FiMOutputSumEventRef {FIM_OUTPUT_SUMMARIZED_EVENT}		
<b>Description</b>	--		
<b>Multiplicity</b>	1		
<b>Type</b>	Reference to [ FiMSummaryEventId ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	VARIANT-PRE-COMPILE

	<b>Link time</b>	--	
	<b>Post-build time</b>	X	VARIANT-POST-BUILD
	<b>Scope / Dependency</b>		

**No Included Containers**

### 10.2.7 FiMInhibitionConfiguration

<b>SWS Item</b>	<b>FIM038_Conf :</b>
<b>Container Name</b>	FiMInhibitionConfiguration
<b>Description</b>	This container includes all configuration parameters concerning the relationship between event and FID.
<b>Configuration Parameters</b>	

<b>SWS Item</b>	<b>FIM096_Conf :</b>		
<b>Name</b>	FiMInhInhibitionMask {FIM_INH_INHIBITION_MASK}		
<b>Description</b>	The configuration parameter is used to specify the inhibition mask for an event - FID relation.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucEnumerationParamDef		
<b>Range</b>	FIM_LAST_FAILED	Last Failed - DEM_UDS_STATUS_TF flag of Dem Eventstatus is set Use case: Re-configuration, avoiding follow-up errors	
	FIM_NOT_TESTED	Not Tested this cycle - DEM_UDS_STATUS_TNCTOC flag of Dem Eventstatus is set. Use case: Scheduling of monitors.	
	FIM_TESTED	Tested - DEM_UDS_STATUS_TNCTOC flag of Dem Eventstatus is not set. Use case: Self deactivation, check during driving cycle.	
	FIM_TESTED_AND_FAILED	Tested and Failed - DEM_UDS_STATUS_TF flag of Dem Eventstatus is set and DEM_UDS_STATUS_TNCTOC flag is not set Use case: Avoiding deadlocks, repeated monitoring.	
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	VARIANT-PRE-COMPILE
	<b>Link time</b>	--	
	<b>Post-build time</b>	X	VARIANT-POST-BUILD
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>FIM095_Conf :</b>		
<b>Name</b>	FiMInhFunctionIdRef {FIM_INH_FUNCTION_ID}		
<b>Description</b>	--		
<b>Multiplicity</b>	1		
<b>Type</b>	Reference to [ FiMFID ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	VARIANT-PRE-COMPILE
	<b>Link time</b>	--	
	<b>Post-build time</b>	X	VARIANT-POST-BUILD
<b>Scope / Dependency</b>			

Included Containers		
Container Name	Multiplicity	Scope / Dependency
FiMInhEventId	1	The configuration parameter is used for an existing DEM event and summarized events as well.

### 10.2.8 FiMInhEventId

SWS Item	FIM097_Conf :
Container Name	FiMInhEventId{FIM_INH_EVENT_ID}
Description	The configuration parameter is used for an existing DEM event and summarized events as well.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
FiMInhRefChoice	1	--

### 10.2.9 FiMInhChoiceDemRef

SWS Item	FIM099_Conf :
Container Name	FiMInhChoiceDemRef
Description	--
Configuration Parameters	

<b>SWS Item</b>	<b>FIM100_Conf :</b>		
<b>Name</b>	FiMInhEventRef		
<b>Description</b>	--		
<b>Multiplicity</b>	1		
<b>Type</b>	Reference to [ DemEventParameter ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	--	
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

No Included Containers
------------------------

### 10.2.10 FiMInhChoiceSumRef

SWS Item	FIM101_Conf :
Container Name	FiMInhChoiceSumRef
Description	--
Configuration Parameters	

SWS Item	FIM102_Conf :
Name	FiMInhSumRef
Description	--
Multiplicity	1..*
Type	Reference to [ FiMSummaryEventId ]

<b>ConfigurationClass</b>	<b>Pre-compile time</b>	--	
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

**No Included Containers**

### 10.2.11 FiMInhRefChoice

<b>SWS Item</b>	<b>FIM098_Conf :</b>
<b>Choice container Name</b>	FiMInhRefChoice
<b>Description</b>	--

<b>Container Choices</b>		
<b>Container Name</b>	<b>Multiplicity</b>	<b>Scope / Dependency</b>
FiMInhChoiceDemRef	0..1	--
FiMInhChoiceSumRef	0..1	--

### 10.2.12 FiMSummaryEventId

<b>SWS Item</b>	<b>FIM103_Conf :</b>
<b>Container Name</b>	FiMSummaryEventId
<b>Description</b>	This container defines the name of a summarized event.
<b>Configuration Parameters</b>	

<b>SWS Item</b>	<b>FIM104_Conf :</b>		
<b>Name</b>	FiMEventSumId {FIM_SUMMARIZED_EVENT}		
<b>Description</b>	The summarized EventId definition record defines the existence of a summarized event with a specific name. This summarized event can be referenced in the EventSummary (as FiMSummaryEventId) and Inhibition configuration (as FiMInhEventId).		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
<b>Range</b>	0 .. 65535		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	VARIANT-PRE-COMPILE
	<b>Link time</b>	--	
	<b>Post-build time</b>	X	VARIANT-POST-BUILD
<b>Scope / Dependency</b>			

**No Included Containers**

### 10.3 Published Information

**[FIM105]** 「 The standardized common published parameters as required by BSW00402 in the General Requirements on Basic Software Modules [3] shall be published within the header file of this module and need to be provided in the BSW Module Description. The according module abbreviation can be found in the List of Basic Software Modules [1]」()

Additional module-specific published parameters are listed below if applicable.

## 11 Changes compared to release 4.0.2

## 11.1 Deleted SWS Items

<i>SWS Item</i>	<i>Rationale</i>

## 11.2 Replaced SWS Items

<i>SWS Item of Release 1</i>	<i>replaced by SWS Item</i>	<i>Rationale</i>

### 11.3 Changed SWS Items

- Previous `FimCyclicEventEvaluation` configuration parameter has been renamed into `FimEventUpdateTriggeredByDem`. Therefore, FIM070 and FIM073 requirements have been reworded to improve understandability without changing the technical contents.
- Inhibition masks use `TestFailed` bit instead of `TestFailedThisOperationCycle`. Therefore, ranges of `FimInhInhibitionMask` have been reworded.

## 11.4 Added SWS Items

<i>SWS Item</i>	<i>Rationale</i>

## 12 Not applicable requirements

**[FIM999]** 「 These requirements are not applicable to this specification. 」 (BSW00006, BSW00007, BSW00005, BSW00009, BSW00010, BSW00159, BSW00160, BSW00161, BSW00162, BSW00164, BSW00167, BSW00168, BSW00170, BSW00172, BSW00301, BSW00302, BSW00306, BSW00307, BSW00308, BSW00309, BSW00314, BSW00323, BSW00324, BSW00325, BSW00326, BSW00328, BSW00330, BSW00333, BSW00334, BSW00336, BSW00339, BSW00341, BSW00342, BSW00343, BSW00347, BSW00353, BSW00355, BSW00357, BSW00359, BSW00360, BSW00361, BSW00370, BSW00375, BSW00378, BSW00382, BSW00386, BSW00387, BSW00409, BSW00417, BSW00420, BSW00421, BSW00422, BSW00423, BSW00424, BSW00425, BSW00426, BSW00427, BSW00428, BSW00429, BSW00431, BSW00432, BSW00433, BSW00434, BSW04721)
