## Advice for users

AUTOSAR Specification Documents may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the Specification Documents for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such Specification Documents, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

## 1 Introduction and functional overview

The Communication Manager Module (COM Manager, ComM) is a component of the Basic Software (BSW). It is a Resource Manager, which encapsulates the control of the underlying communication services. The ComM module controls basic software modules relating to communication and not software components or runnable entities. The ComM module collects the bus communication access requests from communication requestors (see definition of term “User” in Chapter 2) and coordinates the bus communication access requests.

The purpose of the ComM module is:

1. Simplifying the usage of the bus communication stack for the user. This includes a simplified network management handling.
2. Coordinating the availability of the bus communication stack (allow sending and receiving of signals) of multiple independent software components on one ECU.

*Comment:* A user should not have any knowledge about the hardware (e.g. on which channel to communicate). A user simply requests a "Communication Mode" and ComM module switches the communication capability of the corresponding channel on/off.

3. Offer an API to disable sending of signals to prevent the ECU from (actively) waking up the communication bus.

*Comment:* On CAN every message wakes up the bus, on FlexRay it is only possible to wake up the bus with a so called wake-up pattern.

4. Controlling of more than one communication bus channel of an ECU by implementing a channel state machine for every channel.

*Comment:* The ComM module requests a Communication Mode from the corresponding Bus State Manager module. The actual bus states are controlled by the corresponding Bus State Manager module.

5. Offering the possibility to force an ECU that keeps the bus awake to the 'No Communication' mode (see Section 7.3.2.2 for details).
6. Simplifying the resource management by allocating all resources necessary for the requested Communication Mode.

*Comment:* E.g. check if communication is allowed when a user requests 'Full Communication' mode, and prevent the ECU from shutdown during communication.

## 2 Acronyms and definitions

Abbreviation / Acronym:	Description:
BSW	Basic Software
BswM	Basic Software Mode Manager
ComM	Communication Manager
DCM	Diagnostic Communication Manager
Det	Development Error Tracer
EcuM	ECU State Manager module
I-PDU	Information Protocol Data Unit
NM	Network Management
PDU	Protocol Data Unit
SW-C	Software Component
VMM	Vehicle Message Matrix

Term:	Description:
DCM_ActiveDiagnostic indication	The DCM module indicates an active diagnostic session. DCM need "full communication" = COMM_FULL_COMMUNICATION for diagnostic purpose
Active wake-up	Wake-up caused by the hosting ECU e.g. by a sensor.
Application signal scheduling	Sending of application signals according to the VMM. Scheduling of CAN application signals is performed by the Communication Module, scheduling of LIN application I-PDUs (a PDU containing signals) is performed by the LIN interface and scheduling of FlexRay application PDUs is performed by the FlexRay Interface module.
Bus sleep	No activity required on the communication bus (e.g. CAN bus sleep).
Bus communication messages	Bus communication messages are all messages that are sent on the communication bus. This can be either a diagnostic message or an application message.
COM Inhibition status	Defines whether full communication, silent communication or wake-up is allowed or not.
Communication Channel	The medium used to convey information from a sender (or transmitter) to a receiver.
Communication Mode	Mode determining which kind of communication are allowed: "full communication" = COMM_FULL_COMMUNICATION "no communication" = COMM_NO_COMMUNICATION "silent communication" = COMM_SILENT_COMMUNICATION <i>Note: COMM_SILENT_COMMUNICATION can not be requested by a user. Internal mode for synchronizing network at shutdown</i>
Diagnostic PDU scheduling	Sending of diagnostic PDUs. Scheduling of CAN diagnostic PDUs is performed by the diagnostic module, scheduling of LIN diagnostic PDUs is performed by the diagnostic module and the LIN interface and scheduling of FlexRay diagnostic PDUs is performed by the diagnostic module and the FlexRay Interface module.
ECU shut down	See ECU State Manager specification [6].
Fan-out	Same message/indication are sent to multiple destinations/receivers
Independent software component	A separately developed software component performing a coherent set of functions with a minimum amount of interfaces to other software applications on an ECU. This can be e.g. a basic software component or an application software component.
Passive wake-up	Wake-up by another ECU and propagated (e.g. by bus or wake-up-line) to the ECU currently in focus.
System User	An administration functionality (a specific "user", which is generated

	within the internal context of the ComM) for making a default request and for overriding the user requests.
User	Concept for requestors of the ECU State Manager module and of the Communication Manager Module. A user may be the BswM, a runnable entity, a SW-C or a group of SW-Cs, which act as a single unit towards the ECU State Manager module and the Communication Manager Module.
User Request	A User can request different Communication Modes from ComM

## 3.2 Related standards and norms

Not applicable.

## **4 Constraints and assumptions**

### **4.1 Limitations**

No limitations.

### **4.2 Applicability to car domains**

No restrictions.

## 5 Dependencies to other modules

A context view which shows the Communication Manager Module and the dependencies to other modules is shown in Figure 1:

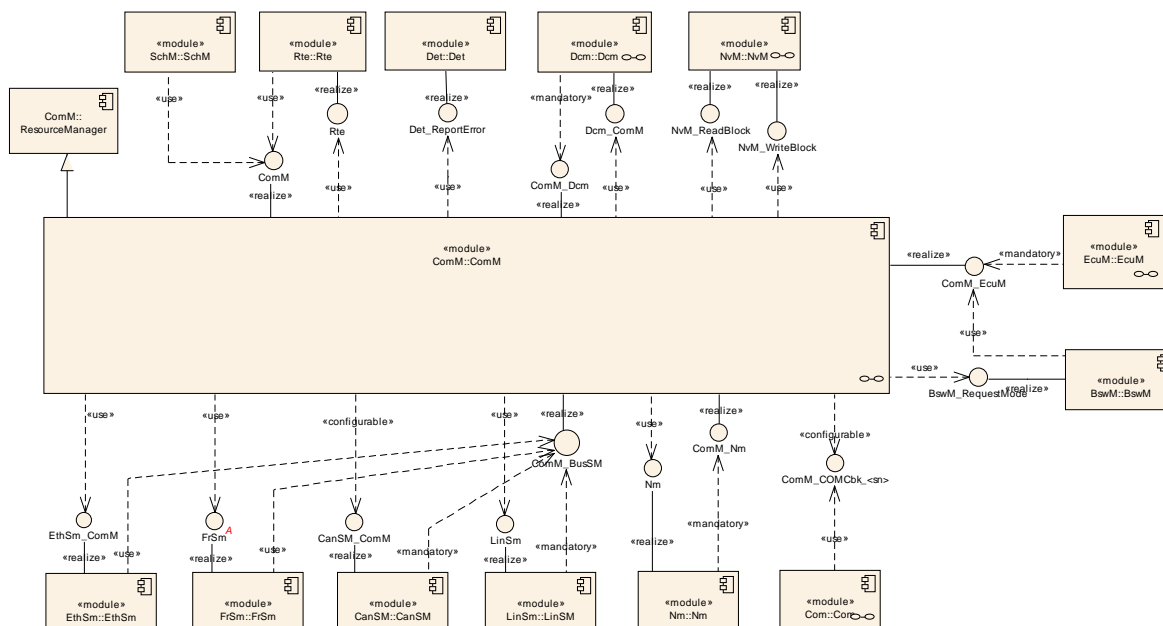

Figure 1: Communication Manager Module context view

The Communication Manager Module requests the communication capabilities, requested from the users, from the Bus State Manager modules.

### 5.1 File structure

#### 5.1.1 Code file structure

The code file structure shall not be defined within this specification completely.

**[ComM503]** «The code file structure shall include a file `ComM_LcCfg.c` for all link time configurable parameters and a file `ComM_PbCfg.c` for all post build time configurable parameters.» (BSW00380, BSW00419)

### 5.1.2 Header file structure

**[ComM466]** «The ComM module shall use the Standard header files. (For details refer to AUTOSAR General Requirements on Basic Software Modules [3]). It is not allowed to redefine AUTOSAR integer data types.»(BSW00304, BSW00355)

**[ComM506]** «The ComM module shall, depending on the ComM configuration, include the header files of the modules providing interfaces to the ComM module (see Figure 1):

ComM Schedule Manager:	SchM_ComM.h
RTE generated header file:	Rte_ComM.h
Development Error Tracer:	Det.h
Diagnostic Communication Manager:	Dcm.h
NVRAM Manager:	NvM.h
ECU State Manager:	EcuM.h
Network Management Interface:	Nm.h
LIN State Manager:	LinSM.h
CAN State Manager:	CanSM.h
FlexRay State Manager:	FrSm.h
Ethernet State Manager:	EthSm.h
Basis Software Manager:	BswM.h
Communication:	Com.h

»(BSW00436)

**[ComM956]** «The module header file ComM.h shall include Rte\_ComM\_Type.h to include the types which are common used by BSW Modules and Software Components. This file shall only contain types, which are not already defined in Rte\_ComM\_Type.h.»()

**[ComM463]** «The ComM module shall provide in addition to ComM\_Lcfg.c and ComM\_PBcfg.c at least the following files:

ComM header file:	ComM.h
ComM callback declarations:	ComM_Nm.h, ComM_EcuMBswM.h, ComM_Dcm.h, ComM_BusSm.h
ComM configuration file:	ComM_Cfg.h
ComM source file:	ComM.c»(BSW00346, BSW00381,

BSW00412, BSW00415, BSW00435)

*Rationale for [ComM463](#):* Source code and configuration are strictly separated. User defined configurations will not imply the change of the original source code.

## 5.2 AUTOSAR Runtime Environment (RTE)

Every user can request a Communication Mode. The RTE propagates the user request to the ComM module and the Communication Mode indications from the ComM to the users (for details refer to [8]).

## 5.3 ECU State Manager (EcuM)

Two different variants of EcuM can be used, called EcuM-Fixed and EcuM-Flex. For details about the difference between the two variants, refer to EcuM-Flex [6] and EcuM-Fixed [30].

The EcuM-Fixed is responsible for initialization of ComM. Both EcuMs are also responsible to validate wake-up events and send an indication to ComM if a wake-up is validated.

If EcuM-Fixed is used, EcuM-Fixed will indicate to ComM if communication is allowed to start or not. Then EcuM-Fixed must check with ComM if the ECU can be shutdown or not, i.e. if communication is in progress or not.

If EcuM-Flex is used, the above functionality (communication allowed and shutdown of ECU) is handled by EcuM-Flex together with BswM.

## 5.4 Basic Software Mode Manager (BswM)

The BswM realizes two functionalities Mode Arbitration and Mode Control to allow the application of an Application Mode Management and a Vehicle Mode Management.

The BswM propagates user requests to the ComM module, if configured in the action lists of BswM to be able to request ComM modes via BswM.

The BswM controls the PDU Groups in the AUTOSAR Communication Module (COM), if the call of `Com_IpduGroupControl` is configured in the action list.

[ComM976] 「ComM indicates all channel main state changes and all PNC state changes to the BswM.」()

If EcuM-Flex is used, BswM will indicate to ComM if communication is allowed or not.

## 5.5 NVRAM Manager

The ComM module uses the NVRAM Manager to store and read non-volatile data. For details on initial values of the NVRAM data refer to Chapter 10.

*Comment:* The NVRAM Manager must be initialized after a power up or reset of the ECU. It must be initialized before ComM, as when ComM is initialized, ComM assumes that NVRAM is ready to be used, and that it can read back non-volatile configuration data. When ComM is de-initialized, it writes non-volatile data to NVRAM.

## 5.6 Diagnostic Communication Manager (DCM)

The DCM performs the scheduling of diagnostic PDUs. The DCM acts as a user by requesting Communication Mode `COMM_FULL_COMMUNICATION` via a “DCM\_ActiveDiagnostic” indication if diagnostics shall be performed. The DCM does not provide an API to start/stop sending and receiving but guarantees that the communication capabilities are according to the ComM module Communication Modes.

## 5.7 LIN State Manager

The LIN State Manager controls the actual states of the LIN bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the LIN State Manager and the LIN State Manager maps the Communication Mode to a bus state.

## 5.8 CAN State Manager

The CAN State Manager controls the actual states of the CAN bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the CAN State Manager and the CAN State Manager maps the Communication Mode to a bus state.

## 5.9 FlexRay State Manager

The FlexRay State Manager controls the actual states of the FlexRay bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the FlexRay State Manager and the FlexRay State Manager maps the Communication Mode to a bus state.

## 5.10 Ethernet State Manager

The Ethernet State Manager controls the actual states of the Ethernet bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the Ethernet State Manager and the Ethernet State Manager maps the Communication Mode to a bus state.

## 5.11 Network Management (NM)

The ComM module uses the NM to synchronize the control of communication capabilities across the network (synchronous start-up and shutdown).

## 5.12 Development Error Tracer (DET)

The DET provides services to store development errors (see Section 7.9).

## 5.13 Communication (COM)

[ComM975] 「The AUTOSAR Communication module (COM) shall be used to distribute the status information about PNCs using COM signals.」()

Document: AUTOSAR General Requirements on Basic Software Modules [3].

Requirement	Satisfied by
[BSW003] Version identification	<a href="#">ComM280</a>
[BSW004] Version check	<a href="#">ComM418</a>
[BSW005] No hard coded horizontal interfaces within MCAL	Not applicable (requirement on implementation, not on specification)
[BSW006] Platform independency	<a href="#">ComM462</a>
[BSW007] HIS MISRA C	<a href="#">ComM462</a>
[BSW009] Module User Documentation	Not applicable (requirement on documentation, not on specification)
[BSW010] Memory resource documentation	Not applicable (requirement on documentation, not on specification)
[BSW101] Initialization interface	<a href="#">ComM146</a>
[BSW158] Separation of configuration from implementation	<a href="#">ComM464</a>
[BSW159] Tool-based configuration	<a href="#">ComM457</a>
[BSW160] Human-readable configuration data	<a href="#">ComM460</a>
[BSW161] Microcontroller abstraction	Not applicable

Requirement	Satisfied by
	(requirement on software architecture, not for a single module)
[BSW162] ECU layout abstraction	Not applicable (requirement on software architecture, not for a single module)
[BSW164] Implementation of interrupt service routines	Not applicable (no interrupt service routines shall be implemented in ComM)
[BSW167] Static configuration checking	<a href="#">ComM419</a>
[BSW168] Diagnostic Interface of SW components	Not applicable (the module does not support a special diagnostic interface)
[BSW170] Data for reconfiguration of AUTOSAR SW-Components	Not applicable (requirement for SW-Cs)
[BSW171] Configurability of optional functionality	<a href="#">ComM555_Conf</a> <a href="#">ComM558_Conf</a> <a href="#">ComM559_Conf</a> <a href="#">ComM561</a>
[BSW00300] Module naming convention	<a href="#">ComM462</a>
[BSW00301] Limit imported information	<a href="#">ComM462</a>
[BSW00302] Limit exported information	<a href="#">ComM462</a>
[BSW00304] AUTOSAR integer data types	<a href="#">ComM466</a>
[BSW00305] Self-defined data types naming convention	<a href="#">ComM462</a>
[BSW00306] Avoid direct use of compiler and platform specific keywords	<a href="#">ComM462</a>
[BSW00307] Global variables naming convention	<a href="#">ComM462</a>
[BSW00308] Definition of global data	<a href="#">ComM462</a>
[BSW00309] Global data with read-only constraint	<a href="#">ComM462</a>
[BSW00310] API naming convention	<a href="#">ComM462</a>
[BSW00312] Shared code shall be reentrant	<a href="#">ComM462</a>
[BSW00314] Separation of interrupt frames and service routines	Not applicable (this module does not implement any interrupt service routines)
[BSW00318] Format of module version numbers	<a href="#">ComM280</a>
[BSW00321] Enumeration of module version	<a href="#">ComM469</a>

Requirement	Satisfied by
numbers	
[BSW00323] API parameter checking	<a href="#">ComM234</a>
[BSW00325] Runtime of interrupt service routines	Not applicable (this module does not implement any interrupt service routines)
[BSW00326] Transition from ISRs to OS tasks	Not applicable (this module does not implement any interrupt service routines)
[BSW00327] Error values naming convention	<a href="#">ComM234</a>
[BSW00328] Avoid duplication of code	<a href="#">ComM462</a>
[BSW00329] Avoidance of generic interfaces	<a href="#">ComM462</a>
[BSW00330] Usage of macros / inline functions instead of functions	<a href="#">ComM462</a>
[BSW00331] Separation of error and status values	<a href="#">ComM649</a> , section 8.2.1
[BSW00333] Documentation of callback function context	section 8.4
[BSW00334] Provision of XML file	<a href="#">ComM460</a>
[BSW00335] Status values naming convention	section 8.2.1
[BSW00336] Shutdown interface	<a href="#">ComM147</a>
[BSW00337] Classification of errors	<a href="#">ComM234</a>
[BSW00338] Reporting of development errors	<a href="#">ComM270</a>
[BSW00339] Reporting of production relevant error status	<a href="#">ComM515</a>
[BSW00341] Microcontroller compatibility documentation	Not applicable (requirement on documentation, not on specification)
[BSW00342] Usage of source code and object code	<a href="#">ComM459</a>
[BSW00343] Specification and configuration of time	Not applicable (timing constraints for alive-supervision are defined in number of executions)
[BSW00344] Reference to link-time configuration	Not applicable (this module does not provide link-time parameters)
[BSW00345] Pre-compile-time configuration	<a href="#">ComM456</a>
[BSW00346] Basic set of module files	<a href="#">ComM463</a>
[BSW00347] Naming separation of different	<a href="#">ComM462</a>

Requirement	Satisfied by
instances of BSW drivers	
[BSW00348] Standard type header	<a href="#">ComM820</a>
[BSW00350] Development error detection keyword	<a href="#">ComM555_Conf</a>
[BSW00353] Platform specific type header	Not applicable
[BSW00355] Do not redefine AUTOSAR integer data types	<a href="#">ComM466</a>
[BSW00357] Standard API return type	<a href="#">ComM820</a>
[BSW00358] Return type of init() functions	<a href="#">ComM146</a>
[BSW00359] Return type of callback functions	section 8.4
[BSW00360] Parameters of callback functions	section 8.4
[BSW00361] Compiler specific language extension header	Not applicable
[BSW00369] Do not return development error codes via API	<a href="#">ComM649</a>
[BSW00370] Separation of callback interface from API	section 8.4
[BSW00371] Do not pass function pointers via API	<a href="#">ComM462</a>
[BSW00373] Main processing function naming convention	<a href="#">ComM429</a>
[BSW00374] Module vendor identification	<a href="#">ComM280</a>
[BSW00375] Notification of wake-up reason	Not applicable (this module does not implement wake-up interrupts)
[BSW00376] Return type and parameters of main processing functions	<a href="#">ComM429</a>
[BSW00377] Module specific API return types	<a href="#">ComM649</a>
[BSW00378] AUTOSAR boolean type	Not applicable (requirement on implementation, not for specification)
[BSW00379] Module identification	<a href="#">ComM280</a>
[BSW00380] Separate C-Files for configuration parameters	<a href="#">ComM503</a>
[BSW00381] Separate configuration header file for pre-compile time parameters	<a href="#">ComM463</a>
[BSW00383] List dependencies of	section 5.1

Requirement	Satisfied by
configuration files	
[BSW00384] List dependencies to other modules	chapter 5
[BSW00385] List possible error notifications	<a href="#">ComM234</a>
[BSW00386] Configuration for detecting an error	<a href="#">ComM377</a> <a href="#">ComM234</a>
[BSW00387] Specify the configuration class of callback function	<a href="#">ComM620</a>
[BSW00388] Introduce containers	<a href="#">ComM549</a>
[BSW00389] Containers shall have names	section 10.2
[BSW00390] Parameter content shall be unique within the module	chapter 10
[BSW00391] Parameter shall have unique names	section 10.2
[BSW00392] Parameters shall have a type	section 10.2
[BSW00393] Parameters shall have a range	section 10.2
[BSW00394] Specify the scope of the parameters	section 10.2
[BSW00395] List the required parameters (per parameter)	<a href="#">ComM565_Conf</a>
[BSW00396] Configuration classes	section 10
[BSW00397] Pre-compile-time parameters	section 10.2
[BSW00398] Link-time parameters	Not applicable (this module does not provide link-time parameters)
[BSW00399] Loadable Post-build time parameters	Not applicable (this module does not provide Post-build-time parameters)
[BSW00400] Selectable Post-build time parameters	Not applicable (this module does not provide Post-build-time parameters)
[BSW00401] Documentation of multiple instances of configuration parameters	section 10.2
[BSW00402] Published information	<a href="#">ComM280</a>
[BSW00404] Reference to post build time configuration	Not applicable (this module does not provide Post-build-

Requirement	Satisfied by
	time parameters)
[BSW00405] Reference to multiple configuration sets	Not applicable (this module does not provide multiple configuration sets)
[BSW00406] Check module initialization	<a href="#">ComM242</a>
[BSW00407] Function to read out published parameters	<a href="#">ComM370</a>
[BSW00408] Configuration parameter naming convention	section 10.2
[BSW00409] Header files for production code error IDs	<a href="#">ComM508</a>
[BSW00410] Compiler switches shall have defined values	section 10.2
[BSW00411] Get version info keyword	<a href="#">ComM622_Conf</a>
[BSW00412] Separate H-File for configuration parameters	<a href="#">ComM463</a>
[BSW00413] Accessing instances of BSW modules	Not applicable (requirement on implementation, not on specification)
[BSW00414] Parameter of init function	<a href="#">ComM146</a>
[BSW00415] User dependent include files	<a href="#">ComM463</a>
[BSW00416] Sequence of Initialization	Not applicable
[BSW00417] Reporting of Error Events by Non-Basic Software	Not applicable (requirement for SW-Cs)
[BSW00419] Separate C-Files for pre-compile time configuration parameters	<a href="#">ComM503</a>
[BSW00422] Pre--de--bouncing of production relevant error	Not applicable
[BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces	Not applicable (requirement on documentation, not on specification)
[BSW00424] BSW main processing function task allocation	Not applicable (requirement on implementation, not on specification)
[BSW00425] Trigger conditions for schedulable objects	Not applicable (requirement on documentation, not on specification)
[BSW00426] Exclusive areas in BSW modules	Not applicable (requirement on documentation, not on specification)
[BSW00427] ISR description for BSW modules	Not applicable (this module does not implement any interrupt service routines)
[BSW00428] Execution order dependencies of main	Not applicable

Requirement	Satisfied by
processing functions	(requirement on implementation, not on specification)
[BSW00429] Restricted BSW OS functionality access	Not applicable (requirement on implementation, not on specification)
[BSW00431] The BSW Scheduler module implements task bodies	Not applicable (requirement on implementation, not on specification)
[BSW00432] Modules should have separate main processing functions for read/receive and write/transmit data path	Not applicable (this module does not receive and transmit data path)
[BSW00433] Calling of main processing functions	Not applicable (requirement on implementation, not on specification)
[BSW00434] The Schedule Module shall provide an API for exclusive areas	Not applicable (requirement on implementation, not on specification)
[BSW00435] Module Header File Structure for the Basic Software Scheduler	<a href="#">ComM463</a>
[BSW00436] Module Header File Structure for the Basic Memory Mapping	<a href="#">ComM506</a>
[BSW00437] NoInit--Area in RAM	Not applicable
[BSW00438] Post Build Configuration Data Structure	Not applicable (this module does not provide Post-build-time parameters)
[BSW00439] Declaration of interrupt handlers and ISRs	Not applicable
[BSW00440] Function prototype for callback functions of AUTOSAR Services	section 8.4
[BSW00441] Enumeration literals and #define naming convention	<a href="#">ComM649</a> and <a href="#">ComM863</a>

Document: AUTOSAR Requirements on Mode Management [4].

Requirement – Normal Operation	Satisfied by
[BSW09078] Coordinating communication requests	<a href="#">ComM686</a> <a href="#">ComM283</a>
[BSW049] Initiating wake-up and keeping awake physical channels	<a href="#">ComM869</a> , <a href="#">ComM870</a>
[BSW09080] Physical channel independency	<a href="#">ComM051</a>
[BSW09081] API for requesting communication	<a href="#">ComM110</a>
[BSW09083] Support of different communication modes	<a href="#">ComM867</a> , <a href="#">ComM868</a> , <a href="#">ComM845</a> , <a href="#">ComM846</a>

[BSW09084] API for querying the current communication mode	<a href="#">ComM083</a>
[BSW09172] Evaluation of current communication mode	<a href="#">ComM176</a>
[BSW09149] API for querying the requested communication mode	<a href="#">ComM079</a>
[BSW09085] Indication of communication mode changes	<a href="#">ComM091</a>
[BSW09168] Pseudo-channel for local communication	<a href="#">ComM664</a> , <a href="#">ComM567_Conf</a>
[BSW09071] Limit Communication Manager modes	<a href="#">ComM303</a>
[BSW09157] Revoke Communication Manager mode limitation	<a href="#">ComM156</a> <a href="#">ComM163</a> <a href="#">ComM124</a>
[BSW09087] Minimum duration of communication request after wakeup	<a href="#">ComM893</a> , <a href="#">ComM894</a>
[BSW09089] Preventing waking up physical channels	<a href="#">ComM302</a>
[BSW09155] Counting of inhibited communication requests	<a href="#">ComM138</a>
[BSW09156] API to retrieve the number of inhibited "Full Communication" mode requests	<a href="#">ComM224</a> <a href="#">ComM108</a>

Requirement - Configuration	Satisfied by
[BSW09090] User-to-channel relationship	<a href="#">ComM159</a>
[BSW09133] Assigning physical channels to the Communication Manager	<a href="#">ComM327</a>
[BSW09132] Assigning Network Management to physical channels	<a href="#">ComM568_Conf</a>
[BSW09141] Configuration of physical	<a href="#">ComM559_Conf</a>

Requirement - Configuration	Satisfied by
channel wake-up prevention	
[BSW09207] Configurable Assignment of Bus State Managers	<a href="#">ComM567_Conf</a>

## 7 Functional specification

The Communication Manager (ComM) module simplifies the resource management for the users, whereat users may be runnable entities, SW-Cs, the BswM (e.g. SW-C request via BswM) or DCM (communication needed to diagnostic purpose).

**[ComM867]** «The ComM shall provide three different Communication Modes. The highest Communication Mode shall be COMM\_FULL\_COMMUNICATION. The lowest Communication Mode shall be COMM\_NO\_COMMUNICATION.»(BSW09083)

**[ComM151]** «For a user it shall only be possible to request the Communication Modes COMM\_NO\_COMMUNICATION and COMM\_FULL\_COMMUNICATION (see ComM\_RequestComMode( ), [ComM110](#)).»()

*Rationale for [ComM151](#):* The Communication Mode

COMM\_SILENT\_COMMUNICATION and sub-modes/sub-states are only necessary for synchronization with AUTOSAR NM.

**[ComM868]** «The Communication Mode COMM\_SILENT\_COMMUNICATION shall only be used for network synchronization.»(BSW09083)

Note: The possibility to request COMM\_SILENT\_COMMUNICATION mode is removed since release 2.0.

*Comment:* The ComM module allows querying the Communication Mode requested by a particular user (see ComM\_GetRequestedComMode( ), [ComM079](#)).

*Comment:* The ComM module allows querying the actual Communication Mode of a channel (see ComM\_GetCurrentComMode( ), [ComM083](#))

**[ComM845]** «In COMM\_FULL\_COMMUNICATION mode, the ComM module shall allow transmission and reception on the affected physical channel.»(BSW09083)

**[ComM846]** 「In `COMM_NO_COMMUNICATION` mode, the ComM module shall prevent transmission and reception on the affected physical channel.」(BSW09083)

**[ComM686]** 「If at least one of multiple independent user requests demands a higher Communication Mode (see [ComM867](#) and [ComM868](#)), the ComM module shall set this higher Communication Mode as the target Communication Mode.」(BSW09078)

*Rationale for [ComM686](#):* ComM coordinates multiple independent user requests according to the "highest wins" strategy: `COMM_FULL_COMMUNICATION` Communication Mode overrules `COMM_NO_COMMUNICATION`.

**[ComM500]** 「The ComM module shall not queue user requests. The latest user request of the same user shall overwrite an old user request even if the request is not finished.」()

**[ComM866]** 「An `DCM_ActiveDiagnostic` indication shall be treated as a `COMM_FULL_COMMUNICATION` request for the specified communication channel (see `ComM_DCM_ActiveDiagnostic(channel)`, [ComM873](#)).」()

*Rationale for [ComM866](#):* If more channels needed for diagnostic purpose, DCM needs to indicate `DCM_ActiveDiagnostic` for each channel.

**[ComM092]** 「There shall be one Communication Mode target state (evaluated according to [ComM686](#)) per communication channel. This target mode can differ temporarily from the actual mode controlled by the corresponding Bus State Manager module.」()

*Comment:* Mode switching by the corresponding Bus State Manager module takes time and a mode inhibition can be active.

**[ComM084]** 「The ComM module shall propagate a call of `ComM_GetCurrentComMode()` (see [ComM083](#)) to the Bus State Manager module(s) for the channel(s) the user are configured to (see also [ComM176](#) and [ComM798](#)).」()

*Rationale for [ComM084](#):* State requests have to be propagated to the corresponding Bus State Manager module since the ComM module does not control the actual bus state.

*Comment:* This feature is not used by a "normal SW-C" because they don't have knowledge about channels. This feature is necessary for privileged SW-Cs, which (have to) know about the system topology, e.g. system diagnostic functions.

**[ComM884]** 「The ComM module shall store status if communication for a channel is allowed or not allowed in separate `CommunicationAllowed` boolean flags for all supported channels. The default value after ComM initialization shall be communication is not allowed, i.e.  
`CommunicationAllowed=FALSE.」()`

**[ComM885]** 「Status changes for communication allowed or not allowed in [ComM884](#) shall be provided to ComM in  
`ComM_CommunicationAllowed(<channel>, TRUE | FALSE)` ([ComM871](#)) indications.」()

## 7.1 Partial Network Cluster Management

### 7.1.1 Overview

ComM implements a state machine for each partial network cluster (PNC) to represent the communication mode of a PNC.

Each PNC has its own state. The state definitions are related to the states of ComM for a simple mapping.

ComM users are used to request and release the PNCs.

The status of all PNCs on the nodes of a system channel is exchanged via network management user data.

Each PNC uses a dedicated bit position within a bit vector in the NM user data on CAN and FlexRay. If a PNC is requested by a local ComM user on the node, the node sets the corresponding bit in the NM user data to 1. If the PNC is not requested anymore; the node sets the corresponding bit in the NM user data to 0. The BusNms collect and aggregate the NM user data for the PNCs and provide the status via a COM bit vector by means of a COM signal to ComM.

Each PNC uses the same bit position in the NM user data on every system channel with NM. ComM uses two types of bit vector named EIRA and ERA to exchange PNC status information. The definition of “EIRA” and “ERA” are located in the AUTOSAR SWS CAN NM and AUTOSAR SWS FlexRay NM.

ComM requests and releases the system communication bus channels needed for a PNC on a node.

Enabling or disabling the partial network cluster management in the node shall be post-build selectable. In order to enable or disable the PNC during runtime e.g. by a diagnostic service, the requested enabling or disabling PNC shall be stored non volatile and executed after the ECU reset during the startup.

Partial networking shall be supported on the bus types CAN, FlexRay. Activation and deactivation of the I-PDU groups of the PNCs on a FlexRay node is required to avoid false timeouts. Starting and Stopping of I-PDU groups in COM are handled in BSWM. Deactivation of single FlexRay ECU is not possible.

### 7.1.2 Partial Network Cluster Management Functionality

[ComM910] 「PNC functionality shall only exist if the parameter ComMPncSupport is set to TRUE. (see ComM839\_Conf).」()

[ComM911] 「Enabling or disabling of the PNC functionality shall be post-build selectable using the parameter ComMPncEnabled (see ComM878\_Conf).」()

[ComM999] 「The parameter ComMPncEnable shall be stored non volatile and evaluated after the ECU reset during the startup.」()

Comment: This is required to be able to enable or disable the PNC during runtime e.g. by a diagnostic service.

Comment: The ComM module notifies the BswM about every state change of the PNC state machine by calling `BswM_ComM_CurrentPncMode( )`. (refer to ComM908)

[ComM982] 「For exchanging PNC status information, bit vectors shall be used. (i.e. only one signal containing a maximum of 48 PNC status information bits).」()

[ComM984] 「ComM receives the bit vectors (signals) which can be ComMPncComSignalKind EIRA or ERA using `Com_ReceiveSignal()`.」()

[ComM986] 「The ComM shall provide the API `ComM_COMCbk_<sn>( )` to indicate a change of signal(s) within the module communication.」()

[ComM916] 「The ComM module shall be able to distribute the status of a PNC (result of the PNC state machine) via one or more communications busses using one or more COM signals ,as a bit vector, containing a bit which represents the status of the PNC with `ComMPncComSignalDirection` “TX” assigned to this PNC. (For more details, refer to ComM988).」()

### 7.1.3 ComM PNC state machine

[ComM953] 「If the PNC functionality is enabled using the configuration parameter ComMPncEnabled set to TRUE (see ComM878\_Conf), all actions related to PNC changes shall be executed before the channel related actions (channel related actions, see Chapter 7.3). 」()

[ComM909] 「For every Partial Network, only one PNC state machine shall be implemented (i.e. One PNC state machine per PNC, independent of the amount of ComMChannels). 」()

[ComM920] 「The ComM module shall support up to 48 PNC state machines. 」()

[ComM924] 「The PNC state machine shall consist of the two main states PNC\_FULL\_COMMUNICATION and PNC\_NO\_COMMUNICATION. 」()

[ComM907] 「The PNC main state PNC\_FULL\_COMMUNICATION shall consist of the sub states PNC\_PREPARE\_SLEEP, PNC\_READY\_SLEEP and PNC\_REQUESTED. 」()

[ComM908] 「Every state change (main or substate), excluding entering of the main state PNC\_NO\_COMMUNICATION coming from PowerOff, shall be notified by the API call BswM\_ComM\_CurrentPncMode() with the entered PNC state. 」()

[ComM978] 「State transitions of the PNC state machines in ComM, triggered by a call to ComM\_RequestComMode() shall be executed in the ComM main task only. 」()

Comment: Every PN activation triggers sending of the PN-vector n-times thus it would increase the busload without debouncing.

[ComM944] 「If at least one bit corresponding to the PNC within the Rx bitvectors with signal type "EIRA" equals '1', then the bit corresponding to this PNC within EIRA in ComM shall be set to '1'. 」()

[ComM945] 「If the configuration parameter ComMPncGatewayEnabled (see ComM840\_Conf) is true and the parameter ComMPncGatewayType is set to COMM\_GATEWAY\_TYPE\_ACTIVE for a ComMChannel and at least one bit corresponding to the PNC within the Rx bitvectors with signal type "ERA" equals '1', then the bit corresponding to this PNC within ERA in ComM shall be set to '1'. 」()

[ComM971] 「The trigger `ComM_COMCbk` represents a notification by the AUTOSAR Communication module about a received signal containing PNC status information called ERA of EIRA.」()

[ComM972] 「The trigger “ComMUser” represents a notification about a communication request of a ComMUser by calling the API `ComM_RequestComMode( )`.」()

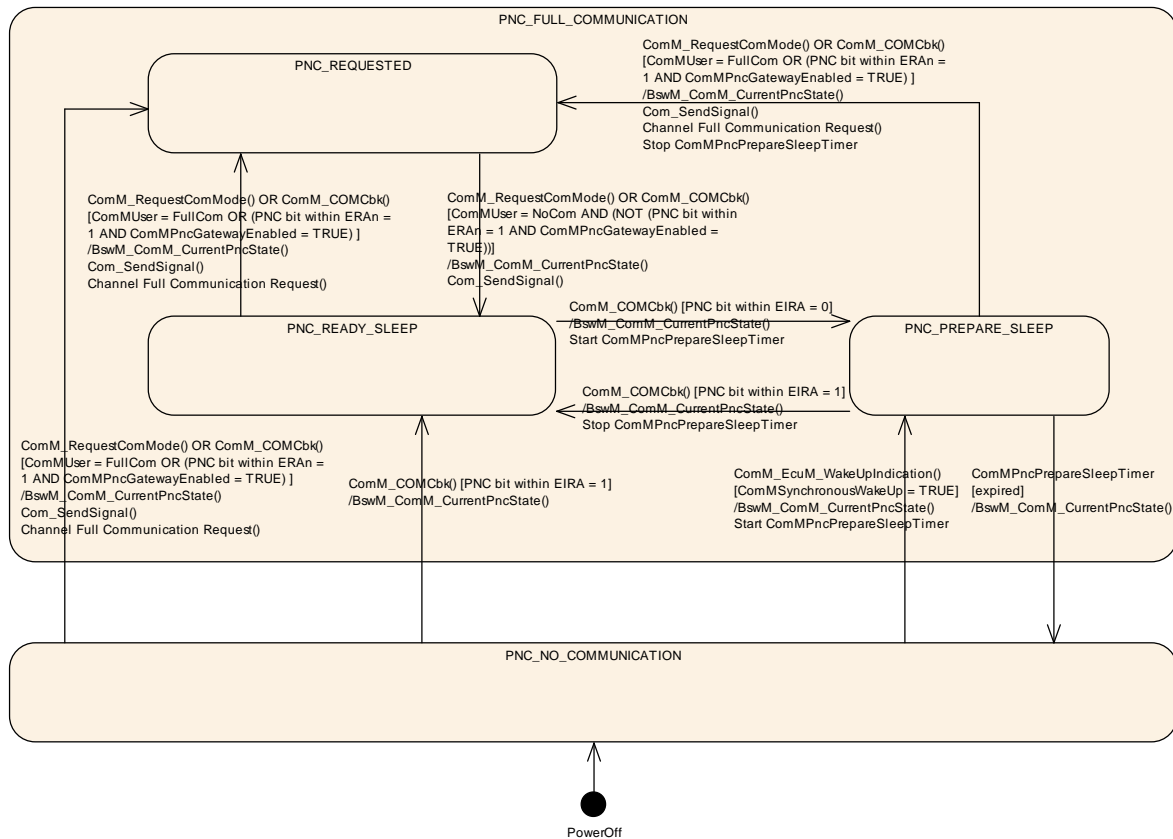

[ComM987] 「Within the ComM main task, the requested state shall be handled in the following order:

1. ComM user requests of ComM users mapped to one or more PNCs
2. ComM user requests of ComM users mapped to one or more channels
3. ERA (if the configuration switch `ComMPncGatewayEnabled` is set to TRUE)
4. EIRA」()

[ComM919] 「It shall be possible to assign more than one COM signal containing bits representing the PNC to one PNC using the configuration container `ComMPncComSignal` (see `ComM881_Conf`).」()

Rational: This allows the configurator to assign e.g. one EIRA and n ERAs to one PNC.

Comment: The different IDs of EIRA can be configured to the physical supported channels FlexRay, Can1, Can2 ...

[ComM988] 「Figure 2: PNC State Machine」()

### 7.1.3.1 Behavior in PNC main state PNC\_NO\_COMMUNICATION

[ComM926] 「The PNC main state PNC\_NO\_COMMUNICATION shall be the default PNC state from power off.」()

[ComM925] 「The main state PNC\_NO\_COMMUNICATION shall be the target state as long as the PNC is neither requested ECU internally nor requested externally.」()

[ComM931] 「If the API `ComM_EcuM_WakeUpIndication()` is called in PNC state PNC\_NO\_COMMUNICATION, and the configuration switch `ComMSynchronousWakeUp` is set to TRUE (see ComM695), the PNC main state PNC\_NO\_COMMUNICATION shall be left and the PNC sub state PNC\_PREPARE\_SLEEP shall be entered.」()

[ComM990] 「If the API `ComM_EcuM_WakeUpIndication()` is called in PNC state PNC\_NO\_COMMUNICATION, and the configuration switch `ComMSynchronousWakeUp` is set to FALSE, the PNC main state PNC\_NO\_COMMUNICATION shall be the current state.」()

Comment: In case of asynchronous wake up, the PNC state shall stay in PNC\_NO\_COMMUNICATION until the PNC request is received (PNC bit in EIRA is set to '1').

[ComM932] 「When at least one ComMUser assigned to this PNC requests “Full Communication” in PNC main state PNC\_NO\_COMMUNICATION, this state shall be left and the sub state PNC\_REQUESTED of the main state PNC\_FULL\_COMMUNICATION shall be entered.」()

[ComM933] 「When in main state PNC\_NO\_COMMUNICATION at least one bit representing this PNC in EIRA changes to '1', the main state PNC\_NO\_COMMUNICATION shall be left and the PNC\_READY\_SLEEP shall be entered.」()

[ComM934] 「When in main state PNC\_NO\_COMMUNICATION at least one bit representing this PNC in an ERAn changes to '1', the main state PNC\_NO\_COMMUNICATION shall be left and the sub state PNC\_REQUESTED shall be entered if the parameter ComMPncGatewayEnabled (ComM840\_Conf) equals TRUE.」()

#### **7.1.3.2 On entry of PNC main state PNC\_NO\_COMMUNICATION from PowerOff**

[ComM927] 「After switching on the power supply, main state PNC\_NO\_COMMUNICATION shall be entered from PowerOff.」()

#### **7.1.3.3 Behavior in PNC main state PNC\_FULL\_COMMUNICATION**

[ComM929] 「All ComMChannels assigned to this PNC shall be in state Full Communication.」()

#### **7.1.3.4 On entry of PNC sub state PNC\_REQUESTED**

[ComM930] 「When entering the PNC sub state PNC\_REQUESTED and if ComMPncGatewayEnabled = FALSE, the API Com\_SendSignal( ) shall be called with the value '1' for the bit representing this PNC for the Com signal assigned to this PNC with ComMPncComSignalDirection “TX”.」()

[ComM992] 「When entering the PNC sub state PNC\_REQUESTED and if ComMPncGatewayEnabled = TRUE, the PNC bit within ERA shall be calculated according to ComM959. The API Com\_SendSignal( ) shall be then called with the

result of the bits representing this PNC for all Com signals assigned to this PNC with `ComMPncComSignalDirection` "TX".\_j()

[ComM993] 「Every time the sub state `PNC_REQUESTED` is entered from other states, all configured ComM channels for this PNC shall be requested "Full communication", even if the channel is already requested.\_j()

#### **7.1.3.5 Behavior in PNC sub state `PNC_REQUESTED`**

[ComM936] 「As long as at least one ComMUser assigned to this PNC requests "Full Communication", `PNC_REQUESTED` shall be the current PNC state.\_j()

[ComM937] 「As long as a PNC is requested remotely (i.e. at least one bit within the ERA signal assigned to this PNC equals '1') and the configuration switch `ComMPncGatewayEnabled` is set to `TRUE` (see `ComM840_Conf`), `PNC_REQUESTED` shall be the current PNC state.\_j()

[ComM938] 「When all ComMUsers assigned to this PNC request "No Communication", the sub state `PNC_REQUESTED` shall be left and the sub state `PNC_READY_SLEEP` shall be entered, if the configuration switch `ComMPncGatewayEnabled` is set to `FALSE`.\_j()

[ComM991] 「When all ComMUsers assigned to this PNC request "No Communication" and the PNC bit in all ERA is equal to 0, the sub state `PNC_REQUESTED` shall be left and the sub state `PNC_READY_SLEEP` shall be entered, if the configuration switch `ComMPncGatewayEnabled` is set to `TRUE`.\_j()

#### **7.1.3.6 On entry PNC sub state `PNC_READY_SLEEP`**

[ComM960] 「When entering the PNC sub state `PNC_READY_SLEEP` from `PNC_REQUESTED`, the API `Com_SendSignal()` shall be called with the value '0' for the bit representing this PNC for all Com signals assigned to this PNC with `ComMPncComSignalDirection` "TX".\_j()

#### **7.1.3.7 Behavior in PNC sub state `PNC_READY_SLEEP`**

[ComM942] 「As long as the PNC is requested (i.e. at least one PNC bit within EIRA equals '1') and no ComMUser assigned to this PNC requests "Full Communication", `PNC_READY_SLEEP` shall be the current state.\_j()

[ComM940] 「If the PNC is released (i.e. all PNC bits within EIRA equals '0'), the sub state PNC\_READY\_SLEEP shall be left and the sub state PNC\_PREPARE\_SLEEP shall be entered. 」()

#### **7.1.3.8 On entry of PNC sub state PNC\_PREPARE\_SLEEP**

[ComM952] 「If the sub state PNC\_PREPARE\_SLEEP is entered, the timer ComMPncPrepareSleepTimer (see ComM841\_Conf) shall be started with the configured initial value. 」()

#### **7.1.3.9 Behavior in PNC sub state PNC\_PREPARE\_SLEEP**

[ComM943] 「As long as the timer ComMPncPrepareSleepTimer (see ComM841\_Conf) is running and no changes in ComMUser, EIRA or ERAn occur, PNC\_PREPARE\_SLEEP shall be the current state. 」()

[ComM947] 「When the timer ComMPncPrepareSleepTimer (see ComM841\_Conf) expires, the PNC sub state PNC\_PREPARE\_SLEEP shall be left and the PNC main state PNC\_NO\_COMMUNICATION shall be entered. 」()

[ComM948] 「When in PNC\_PREPARE\_SLEEP at least one ComMUser assigned to this PNC requests "Full Communication", the PNC\_PREPARE\_SLEEP state shall be left. The timer ComMPncPrepareSleepTimer shall be stopped and the sub state PNC\_REQUESTED state shall be entered. 」()

[ComM950] 「When in PNC\_PREPARE\_SLEEP at least one PNC bit within EIRA changes to '1', the sub state PNC\_PREPARE\_SLEEP shall be left. The timer ComMPncPrepareSleepTimer shall be stopped and the sub state PNC\_READY\_SLEEP shall be entered. 」()

[ComM951] 「When in sub state PNC\_PREPARE\_SLEEP at least one PNC bit within ERAn changes to '1' and the parameter ComMPncGatewayEnabled equals TRUE, the sub state PNC\_PREPARE\_SLEEP shall be left. The timer ComMPncPrepareSleepTimer shall be stopped and the sub state PNC\_REQUESTED shall be entered. 」()

#### 7.1.4 PNC Gateway

[ComM981] 「If the configuration parameter `ComMPncGatewayEnabled` (see `ComM840_Conf`) is TRUE, the default gateway type shall be active (`COMM_GATEWAY_TYPE_ACTIVE`).」()

Comment to ComM981:

It can be assumed that both signal types (i.e. `ComMPncComSignalKind = EIRA` and `ComMPncComSignalKind = ERA`) are configured.

##### 7.1.4.1 Active PNC Gateway

[ComM964] 「If the configuration parameter `ComMPncGatewayEnabled` (see `ComM840_Conf`) is TRUE and the parameter `ComMPncGatewayType` is set to `COMM_GATEWAY_TYPE_ACTIVE` for a `ComMChannel` (see `ComM842_Conf`), the active PNC gateway shall behave as described in `ComM988`.」()

Comment: An active PNC gateway on a system channel shall be the last node on a system channel that releases a PNC.

[ComM966] 「An active PNC gateway shall evaluate all system channels `ERAn` signals (`ERAn` bit vectors) if the active PNC gateway is the last node requesting a PNC.」()

Comment: If the bit for a PNC is equal to zero in all `ERAn`, no other node than the PNC gateway is requesting the PNC.

##### 7.1.4.2 Passive PNC Gateway

Comment: The passively coordinated channels exist only if they are connected to more than one PNC gateway. If the PNC gateway functionality of `ComM` is enabled (`ComMPncGatewayEnabled = true`) `ComM` channels mapped to this gateway can be set to type active or passive (`COMM_GATEWAY_TYPE_ACTIVE` or `COMM_GATEWAY_TYPE_PASSIVE`). If a `ComM` channel is mapped to two different PNC gateways, only one gateway coordinates this channel actively, while the other passively. That means, a PNC gateway is always mapped to at least one `ComM` channel type active and may be mapped to one or some `ComM` channels type passive.

[ComM955] 「If the configuration parameter `ComMPncGatewayEnabled` (see `ComM840_Conf`) is enabled and the parameter `ComMPncGatewayType` is set to `COMM_GATEWAY_TYPE_PASSIVE` for a `ComMChannel` (see `ComM842_Conf`), the passive PNC Gateway behavior for this `ComMChannel` shall be implemented by using the filter mechanism for the `COM Tx` signals as described in `[ComM959]`.」()

Comment: A PNC gateway requests the PNC if a local ComM user requests the PNC or at least one PNC bit within ERA originate from the actively coordinated system channels of a passive PNC gateway is not equal to 0.

[ComM959] 「The bit representing this PNC within the COM Tx signals shall be set to '0' (before calling the AUTOSAR COM module) for all ComMChannels configured as ComMPncGatewayType = "COMM\_GATEWAY\_TYPE\_PASSIVE" if

- all ComMUsers assigned to this PNC request "No Communication", AND, all ComMPncComSignals, received by Com\_ReceiveSignal() from a channel having the channel attribute ComMPncGatewayType "COMM\_GATEWAY\_TYPE\_ACTIVE" and having the signal attribute ComMPncComSignalDirection "RX" and having the signal attribute ComMPncComSignalKind "ERA" are equal to "0".」()

Comment to ComM959: A PNC gateway calculates the PNCs bit value in the ERA Tx bitvectors to be sent for a passively coordinated channel, in the same manner as the bit value in ERA for an actively coordinated channel (ComM946), but sets the PNC's bit to '0' according to the rules of ComM959.

[ComM946] 「In case the configuration switch ComMPncGatewayEnabled is set to TRUE and the parameter ComMPncGatewayType is set to COMM\_GATEWAY\_TYPE\_PASSIVE, the signal value representing a PNC in ERA shall be new calculated according to ComM959 before calling ComSendSignal().」()

### 7.1.5 ComM User to PNC Relations

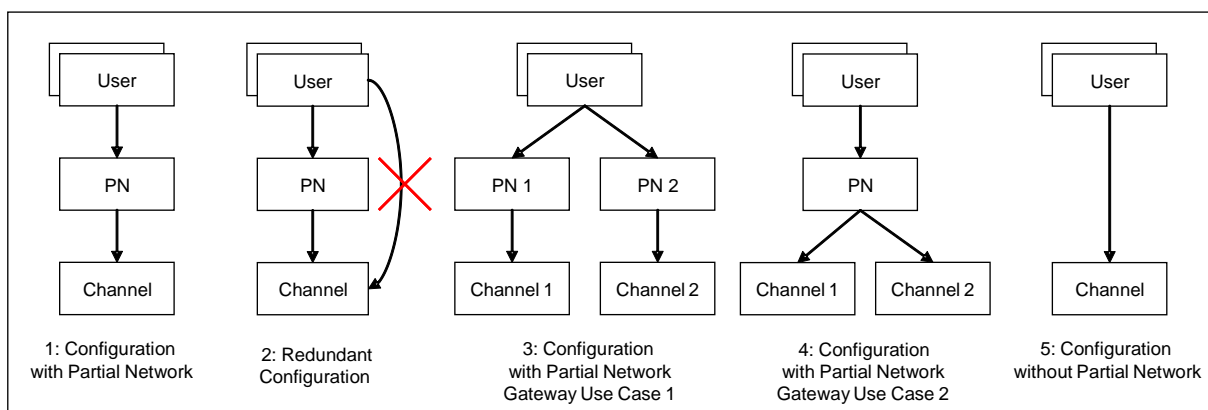

Figure 3: User to Partial network and channel Mapping Use Cases

[ComM912] 「It shall be possible to map a configurable amount of ComMUsers to one or more PNCs using the parameter ComMUserPerPnc (see ComM876\_Conf).」()

[ComM994] 「No restrictions from the configuration of the BusNm Filter for partial networking shall apply to ComM user assignment to PNCs.」()

Comment: The BusNM Filter configuration shall be independant from the ComM PNC configuration.

Rational: This enables waking up a PNC without being a member of the PNC, e.g. if a node just triggers a wake up of a PNC but the node is not kept awake by the PNC and other nodes keep the PNC awake

[ComM995] 「It shall be possible to map a configurable amount of ComMUsers to one or more ComM channels using the parameter ComMUserPerChannel.」()

Comment: The existing mapping of ComM users to system channels shall still be possible for backward compatibility. (i.e. the configuration containers will stay untouched)

[ComM913] 「It shall be possible to map a configurable amount of PNC(s) to a configurable amount of ComM channels using the parameter ComMChannelPerPnc (see ComM880\_Conf).」()

[ComM996] 「It shall not be possible to map a ComMUsers to a PNC and in addition to a ComM channel which is already referenced by the PNC (see figure 3 Use Case 2).」()

Rational: Avoid redundant configuration since the channel is implicitly already referenced by the PNC.

## 7.2 ComM channel state machine

[ComM979] 「If the optional PNC functionality is enabled (see ComM839\_Conf), all PNC actions shall be performed before the channel related actions are executed. 」()

[ComM980] 「If the parameter ComMPncNmRequest equals TRUE (see ComM886\_conf), if the "FULL Communication" is requested due to a change in the PNC state machine to PNC\_REQUESTED (see ComM993)API Nm\_NetworkRequest() shall be called, even if the current state is already "Full communication". 」()

Rationale: It is the trigger to enable the NM to transmit the NM message immediately n-times (n=configurable) to ensure a wake up and a synchronization of the PNC transceiver.

**[ComM051]** 「ComM shall implement one channel state machine as shown in Figure 4 with requirements as listed in Table 1 for every communication channel independently.」(BSW09080)

***Rationale for [ComM051](#):*** Needed communication capability of channels may be different, thus the controlling must be independent.

***Use Case for [ComM051](#):*** On an ECU with CAN and LIN channel, only the LIN requires full communication to request e.g. sensor values while the CAN remains inactive.

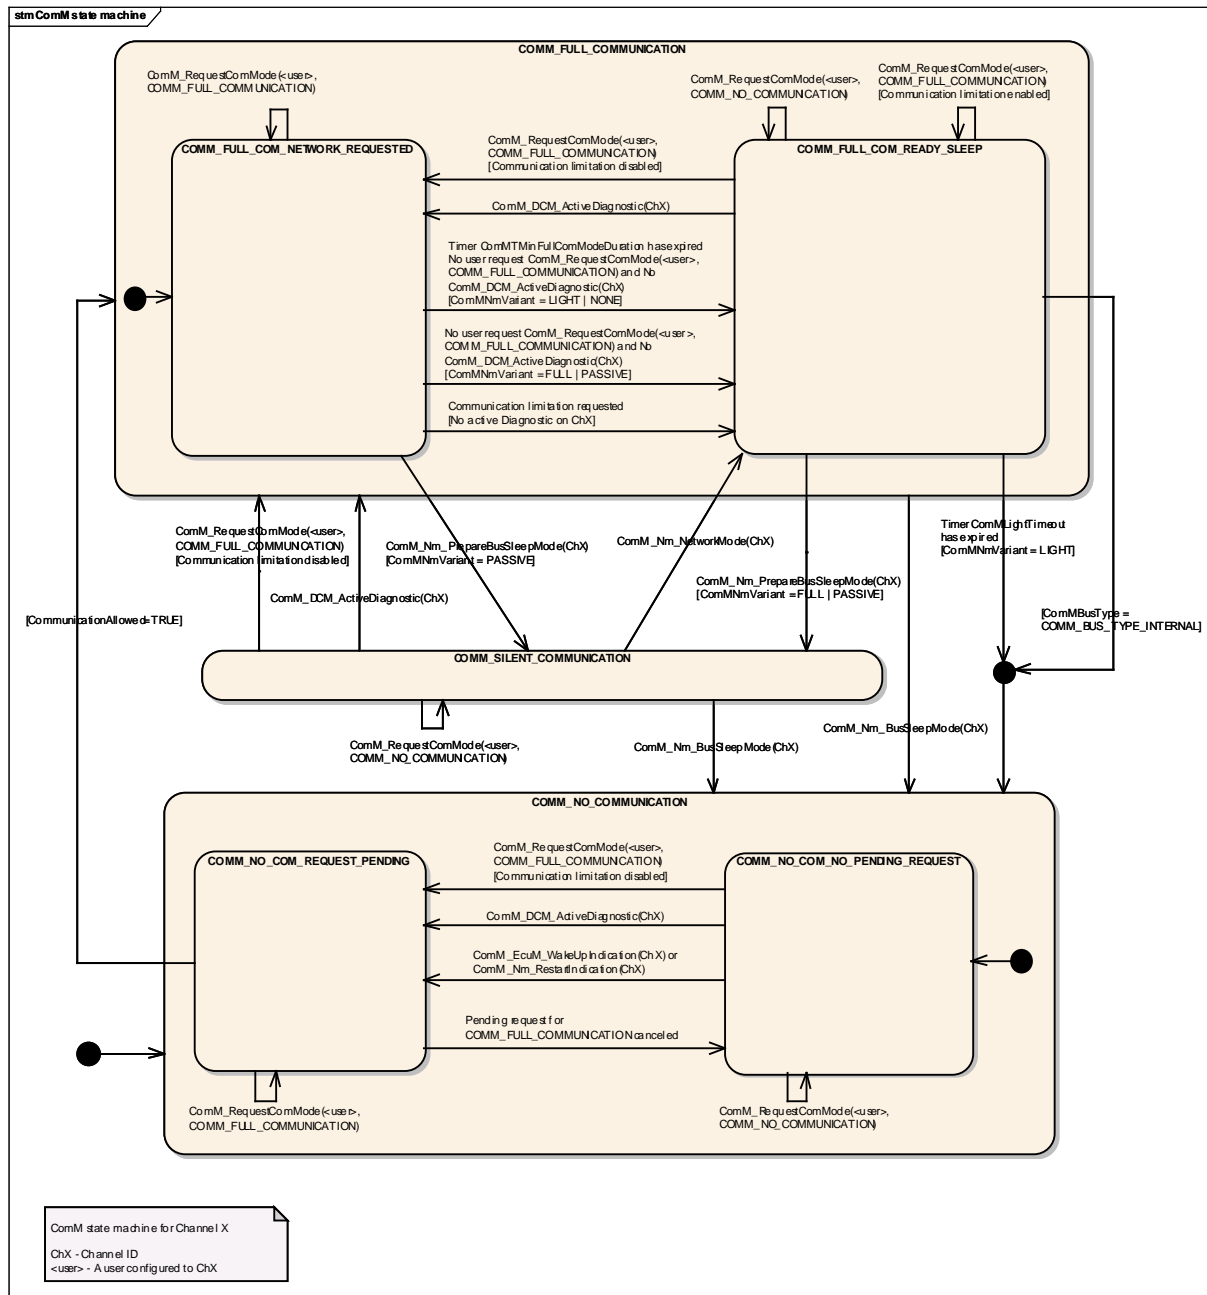

Figure 4: ComM channel state machine

State	Section / Requirement
COMM_NO_COMMUNICATION	7.2.1 Entering state: <a href="#">ComM898</a> , <a href="#">ComM313</a> , <a href="#">ComM073</a> , <a href="#">ComM288</a> In sub-state COMM_NO_COM_NO_PENDING_REQUEST: <a href="#">ComM875</a> , <a href="#">ComM876</a> , <a href="#">ComM893</a> , <a href="#">ComM894</a> , <a href="#">ComM694</a> In sub-state COMM_NO_COM_REQUEST_PENDING: <a href="#">ComM895</a> , <a href="#">ComM897</a> , <a href="#">ComM128</a>
COMM_SILENT_COMMUNICATION	7.2.2 Entering state: <a href="#">ComM071</a> In state: <a href="#">ComM877</a> , <a href="#">ComM878</a> , <a href="#">ComM295</a> , <a href="#">ComM296</a>

	<p>Entering state: <a href="#">ComM069</a></p> <p>In state: <a href="#">ComM637</a></p> <p>7.1.3.1</p> <p>sub-state <code>COMM_FULL_COM_NETWORK_REQUESTED</code>:</p> <p>In sub-state: <a href="#">ComM869</a>, <a href="#">ComM870</a>, <a href="#">ComM665</a>, <a href="#">ComM888</a>, <a href="#">ComM889</a>, <a href="#">ComM890</a></p> <p>7.1.3.2</p> <p>sub-state <code>COMM_FULL_COM_READY_SLEEP</code></p> <p>Entering sub-state: <a href="#">ComM133</a></p> <p>In sub-state: <a href="#">ComM299</a>, <a href="#">ComM610</a>, <a href="#">ComM671</a>, <a href="#">ComM882</a>, <a href="#">ComM883</a><a href="#">ComM479</a></p>
Transition	Requirement
<code>COMM_NO_COMMUNICATION</code> → <code>COMM_FULL_COMMUNICATION</code>	<a href="#">ComM893</a> , <a href="#">ComM894</a> , <a href="#">ComM694</a> , <a href="#">ComM875</a> <a href="#">ComM876</a> ,
<code>COMM_FULL_COM_NETWORK_REQUESTED</code> → <code>COMM_FULL_COM_READY_SLEEP</code>	<a href="#">ComM665</a>
<code>COMM_FULL_COM_READY_SLEEP</code> → <code>COMM_FULL_COM_NETWORK_REQUESTED</code>	<a href="#">ComM882</a> , <a href="#">ComM883</a>
<code>COMM_FULL_COM_READY_SLEEP</code> → <code>COMM_SILENT_COMMUNICATION</code>	<a href="#">ComM299</a>
<code>COMM_FULL_COM_READY_SLEEP</code> → <code>COMM_NO_COMMUNICATION</code>	<a href="#">ComM610</a> , <a href="#">ComM671</a>
<code>COMM_FULL_COMMUNICATION</code> → <code>COMM_NO_COMMUNICATION</code>	<a href="#">ComM637</a>
<code>COMM_SILENT_COMMUNICATION</code> → <code>COMM_FULL_COMMUNICATION</code>	<a href="#">ComM877</a> , <a href="#">ComM878</a>
<code>COMM_SILENT_COMMUNICATION</code> → <code>COMM_FULL_COM_READY_SLEEP</code>	<a href="#">ComM296</a>
<code>COMM_SILENT_COMMUNICATION</code> → <code>COMM_NO_COMMUNICATION</code>	<a href="#">ComM295</a>

Table 1: Link to detailed explanation of the channel state machine resp. transition

**[ComM879]** 「The ComM channel state machine shall consist of the three main states corresponding to the Communication Modes: `COMM_NO_COMMUNICATION`, `COMM_SILENT_COMMUNICATION` and `COMM_FULL_COMMUNICATION`. 」()

**[ComM880]** 「The `COMM_FULL_COMMUNICATION` state shall have two sub-states `COMM_FULL_COM_NETWORK_REQUESTED` and `COMM_FULL_COM_READY_SLEEP`. 」()

**[ComM881]** 「The `COMM_NO_COMMUNICATION` state shall have two sub-states `COMM_NO_COM_REQUEST_PENDING` and `COMM_NO_COM_NO_PENDING_REQUEST`」()

*Rationale for [ComM879](#) and [ComM880](#):* `COMM_FULL_COM_READY_SLEEP` and `COMM_SILENT_COMMUNICATION` are necessary to synchronize a communication shutdown on the bus. If only one ECU switches the communication off, the others store errors because this ECU stops sending application signals.

*Comment:* The main states present an abstracted status of communication capabilities per channel, which are in focus of the users' interests. The sub-states represent intermediate states, which perform activities to support a synchronized transition with external partners and managing protocols (e.g. NM)

**[ComM485]** 「The default state for each ComM channel state machine shall be `COMM_NO_COMMUNICATION`.」()

**[ComM896]** 「Each ComM channel state machine shall only evaluate its corresponding communication status flag `CommunicationAllowed` according to [ComM884](#) in sub-state `COMM_NO_COM_REQUEST_PENDING`.」()

*Rationale for [ComM896](#):* A `ComM_CommunicationAllowed(<channel>, FALSE)` ([ComM871](#)) indication has no visible effect if the channel is not in sub-state `COMM_NO_COM_REQUEST_PENDING`, i.e. ComM channel state machine will not immediately change to state `COMM_NO_COMMUNICATION` if in another state as e.g. `COMM_FULL_COMMUNICATION`

**[ComM472]** «Main state changes (see [ComM879](#)) shall be indicated to the users with the corresponding notifications (see section 8.6.1.4 and 8.6.1.5). Exception: Default state after initialization, see [ComM313](#).»()

*Comment:* If more than one user is related to the corresponding channel state machine, the ComM module has to perform a Fan-out to all users.

**[ComM191]** «The internal functionality of the ComM channel state machine(s) shall be invisible for the users. The user neither needs nor shall get any information about the internal mechanisms and rules (e.g. "highest wins" strategy) of the ComM channel state machine.»()

An overview of the requested communication capabilities in the Corresponding Mode is shown in Table 2.

Communication Mode	Message Transmission	Message Reception	NM (COMM_NM_VARIANT=FULL)	Wake-up/Restart capability
COMM_FULL_COMMUNICATION	On	On	Bus communication requested	N/A
COMM_SILENT_COMMUNICATION	Off	On	Bus communication released	<ul style="list-style-type: none"> <li>• User/diagnostic request</li> <li>• Network indication</li> </ul>
COMM_NO_COMMUNICATION	Off	Off	Bus communication released	<ul style="list-style-type: none"> <li>• User/diagnostic request</li> <li>• Passive wake-up</li> </ul>

Table 2: Granted communication capabilities in the corresponding modes

**Note for section 7.1.1 - 7.1.3:** Each ComM channel state machine is responsible to handle one channel/network with a connected Bus State Manager ("corresponding" = the channel/network the ComM channel state machine is responsible for).

**Note for section 7.1.1 - 7.1.3:** The ComM module contains one or several ComM channel state machine(s). ComM channel state machine communicates directly with

*its connected Bus State Manager, other interfaces are handled by the ComM module.*

### 7.2.1 Behavior in state COMM\_NO\_COMMUNICATION

[ComM898] ⌈On entering state COMM\_NO\_COMMUNICATION the ComM channel state machine shall go to sub-state COMM\_NO\_COM\_NO\_PENDING\_REQUEST.⌋()

[ComM313] ⌈On entering state COMM\_NO\_COMMUNICATION by default after initialization, ComM module shall not indicate the mode change to users via RTE or BswM.⌋()

*Rationale for [ComM313](#):* The RTE is not yet initialized at this point in time.

[ComM073] ⌈On entering state COMM\_NO\_COMMUNICATION the ComM channel state machine shall switch off the transmission and reception capability. This shall be performed by the ComM channel state machine requesting the corresponding Communication Mode from the Bus State Manager module (XXSM\_RequestComMode(network:=<channel state machine's network>, mode:= COMM\_NO\_COMMUNICATION, see [ComM829](#))).⌋()

*Rationale for [ComM073](#):* The COMM\_NO\_COMMUNICATION mode forbids sending and receiving of bus communication PDUs for the corresponding channels.

*Rationale for [ComM073](#), [ComM875](#) and [ComM876](#):* FlexRay shutdown cannot be interrupted to avoid partial networks.

[ComM288] ⌈On entering state COMM\_NO\_COMMUNICATION and configuration parameter ComMNmVariant=FULL (see [ComM568\\_Conf](#)) the ComM module shall request release of the network from the Network Management module, Nm\_NetworkRelease().⌋()

**Comment:** In state COMM\_NO\_COMMUNICATION ComM channel state machine may not request bus communication for the configured channel from the Bus State Manager module.

**Use Case for above Comment:** The ECU is performing control functions locally without participation in bus communication.

**Comment:** The communication mode is local for one channel, thus the ECU may still communicate via other channels.

#### 7.2.1.1 COMM\_NO\_COM\_NO\_PENDING\_REQUEST sub-state

**[ComM875]** 「In sub-state COMM\_NO\_COM\_NO\_PENDING\_REQUEST and user requests COMM\_FULL\_COMMUNICATION and communication limitation is disabled (see Section 7.3.2), the ComM channel state machine shall immediately switch to sub-state COMM\_NO\_COM\_REQUEST\_PENDING.」()

**[ComM876]** 「In sub-state COMM\_NO\_COM\_NO\_PENDING\_REQUEST and DCM indicate ComM\_DCM\_ActiveDiagnostic([ComM873](#)), the ComM channel state machine shall immediately switch to sub-state COMM\_NO\_COM\_REQUEST\_PENDING.」()

Rationale for [ComM876](#): A potential communication limitation (see Section 7.3.2) shall temporarily be inactive during an active diagnostic session, see [ComM182](#)

**[ComM893]** 「In sub-state COMM\_NO\_COM\_NO\_PENDING\_REQUEST and a wake-up-indication is indicated by the EcuM module, ComM\_EcuM\_WakeUpIndication() [ComM275](#), the ComM channel state machine shall immediately switch to sub-state COMM\_NO\_COM\_REQUEST\_PENDING.」(BSW09087)

**[ComM894]** 「In sub-state COMM\_NO\_COM\_NO\_PENDING\_REQUEST and the NM module indicates a restart, ComM\_Nm\_RestartIndication() [ComM792](#), the ComM channel state machine shall immediately switch to sub-state COMM\_NO\_COM\_REQUEST\_PENDING.」(BSW09087)

*Rationale for [ComM893](#) and [ComM894](#):* It must be guaranteed that communication starts as soon as possible after a bus wake up.

*Comment:* The ComM channel state machine switches immediately to sub-state `COMM_FULL_COM_NETWORK_REQUESTED` after entering the `COMM_FULL_COMMUNICATION` state. If no user requests `COMM_FULL_COMMUNICATION` mode, the AUTOSAR NM resp. the ComM module timer for `ComMTMinFullComModeDuration` ([ComM557\\_Conf](#)) prevent toggling between `COMM_NO_COMMUNICATION` and `COMM_FULL_COMMUNICATION` to overcome the init-/start-up time of the system, before possible user requests occur.

**[ComM694]** 「In sub-state `COMM_NO_COM_NO_PENDING_REQUEST` and configuration parameter `ComMSynchronousWakeUp=TRUE` ([ComM695\\_Conf](#)) and a wake-up-indication of a channel is indicated by the EcuM, the ComM module shall immediately switch all ComM channel state machines (resp. channels) to sub-state `COMM_NO_COM_REQUEST_PENDING`.」()

#### 7.2.1.2 `COMM_NO_COM_REQUEST_PENDING` sub-state

**[ComM895]** 「In sub-state `COMM_NO_COM_REQUEST_PENDING` the ComM channel state machine shall evaluate its corresponding `CommunicationAllowed` flag, stored and set according to [ComM884](#) and [ComM885](#). If evaluated to `CommunicationAllowed=TRUE`, the ComM channel state machine shall immediately switch to state `COMM_FULL_COMMUNICATION`.」()

**[ComM897]** 「In sub-state `COMM_NO_COM_REQUEST_PENDING` and no longer any valid pending request for `COMM_FULL_COMMUNICATION`, the ComM channel state machine shall switch back to default sub-state `COMM_NO_COM_NO_PENDING_REQUEST`.」()

*Rationale for [ComM897](#):* The possibility to switch back to default sub-state if communication for some reason was never allowed. E.g. transition to `COMM_NO_COM_REQUEST_PENDING` triggered by user request for `ComM_RequestComMode(<user>, COMM_FULL_COMMUNICATION)` ([ComM871](#)) or DCM indicated `ComM_DCM_ActiveDiagnostic(<channel>)` ([ComM873](#)), but now canceled with

ComM\_RequestComMode(<user>, COMM\_NO\_COMMUNICATION) ([ComM871](#)) or  
DCM ComM\_DCM\_InactiveDiagnostic(<channel>) ([ComM874](#)).

*Comment:* EcuM –Fixed shall read and evaluate ComM channel state machine sub-states, with ComM\_GetState() ([ComM872](#)) before a sleep/shutdown.

## 7.2.2 Behaviour in state COMM\_SILENT\_COMMUNICATION

**[ComM071]** 「On entering state COMM\_SILENT\_COMMUNICATION the ComM channel state machine shall switch off the transmission capability (and keep reception capability on). This shall be performed by the ComM channel state machine requesting the corresponding Communication Mode from the Bus State Manager module

(XXSM\_RequestComMode(network:=<channel state machine's network>, mode:= COMM\_SILENT\_COMMUNICATION) [ComM829](#)).」()

*Rationale for [ComM071](#):* The COMM\_SILENT\_COMMUNICATION mode permits receiving of bus communication PDUs and forbids sending of bus communication PDUs.

*Comment:* It may happen that nothing is received (e.g. during bus off) despite receiving capability is switched on.

*Use Case:* Shut down coordination with means of the NM module (prepare bus sleep state).

**[ComM877]** 「In state COMM\_SILENT\_COMMUNICATION and user requests COMM\_FULL\_COMMUNICATION and communication limitation is disabled (see Section 7.3.2), the ComM channel state machine shall switch to state COMM\_FULL\_COMMUNICATION.」()

**[ComM878]** 「In state COMM\_SILENT\_COMMUNICATION and DCM indicate ComM\_DCM\_ActiveDiagnostic([ComM873](#)), the ComM channel state machine shall switch to state COMM\_FULL\_COMMUNICATION.」()

*Rationale for [ComM878](#):* A potential communication limitation (see Section 7.3.2) shall temporarily be inactive during an active diagnostic session, see [ComM182](#)

**[ComM295]** 「In state `COMM_SILENT_COMMUNICATION` and the Network Manager module indicates `ComM_Nm_BusSleepMode( )` ([ComM392](#)), the ComM channel state machine shall switch to state `COMM_NO_COMMUNICATION`.」()

**[ComM296]** 「In state `COMM_SILENT_COMMUNICATION` and the Network Manager module indicates See `ComM_Nm_NetworkMode( )` [ComM390](#), the ComM channel state machine shall switch to state `COMM_FULL_COMMUNICATION` and sub-state `COMM_FULL_COM_READY_SLEEP`.」()

### 7.2.3 Behaviour in state `COMM_FULL_COMMUNICATION`

**[ComM899]** 「On entering state `COMM_FULL_COMMUNICATION` the ComM channel state machine shall go to sub-state `COMM_FULL_COM_NETWORK_REQUESTED`, if not a specific sub-state is specified in the transition.」()

*Rationale for [ComM899](#):* When switching from `COMM_SILENT_COMMUNICATION`, the ComM channel state machine can switch directly to sub-state `COMM_FULL_COM_READY_SLEEP`, if specified in the transition, see [ComM296](#).

**[ComM069]** 「On entering state `COMM_FULL_COMMUNICATION` the ComM channel state machine shall switch on the transmission and reception capability. This shall be performed by the ComM channel state machine requesting the corresponding Communication Mode from the Bus State Manager module (`XXSM_RequestComMode(network:=<channel state machine's network>, mode:= COMM_FULL_COMMUNICATION)` [ComM829](#)).」()

*Rationale for [ComM069](#):* The `COMM_FULL_COMMUNICATION` mode permits sending and receiving of bus communication PDUs for the corresponding channels.

**[ComM637]** 「In state `COMM_FULL_COMMUNICATION` and the Network Manager module indicates `ComM_Nm_BusSleepMode( )` ([ComM392](#)), the ComM channel state machine shall switch to state `COMM_NO_COMMUNICATION`.」()

**Rationale for [ComM637](#):** A user may request to keep the bus awake "too late" (NM is not able to send a vote to keep the bus awake because the cluster already agreed to shutdown).

### 7.2.3.1 `COMM_FULL_COM_NETWORK_REQUESTED` sub-state

**[ComM886]** 「On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and configuration parameter `ComMNmVariant=LIGHT|NONE` ([ComM568\\_Conf](#)), the timer for `ComMTMinFullComModeDuration` ([ComM557\\_Conf](#)) shall be started.」()

**[ComM665]** 「On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and EcuM module has indicated a wake-up, `ComM_EcuM_WakeUpIndication(<channel>)` ([ComM275](#)), the ComM module shall request `Nm_PassiveStartup(<channel>)` from the Network Management.」()

**[ComM902]** 「On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and Nm module has indicated a restart, `ComM_Nm_RestartIndication(<channel>)` ([ComM792](#)), the ComM module shall request `Nm_PassiveStartup(<channel>)` from the Network Management.」()

**[ComM903]** 「On entering sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and Nm module has indicated a Network start, `ComM_Nm_NetworkStartIndication(<channel>)` ([ComM383](#)), the ComM module shall request `Nm_PassiveStartup(<channel>)` from the Network Management.」()

**Comment for [ComM903](#):** This is not a "normal" transition to `COMM_FULL_COMMUNICATION`, ComM handle `ComM_Nm_NetworkStartIndication( )` as "race condition" error, see section 7.6.1

**[ComM869]** 「In sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and configuration parameter `ComMNmVariant=FULL` ([ComM568\\_Conf](#)) and a

user requests

ComM\_RequestComMode(<user>, COMM\_FULL\_COMMUNICATION)

([ComM110](#)) the ComM module shall request Nm\_NetworkRequest(<all channels connected to user>) from the Network Management for the corresponding NM channels.」(BSW049)

**[ComM870]** 「In sub-state COMM\_FULL\_COM\_NETWORK\_REQUESTED and configuration parameter ComMNmVariant=FULL ([ComM568\\_Conf](#)) and the DCM indicate ComM\_DCM\_ActiveDiagnostic(<channel>) ([ComM873](#)), the ComM module shall request Nm\_NetworkRequest(<channel>) from the Network Management.」(BSW049)

**[ComM887]** 「In sub-state COMM\_FULL\_COM\_NETWORK\_REQUESTED and configuration parameter ComMNmVariant=LIGHT|NONE ([ComM568\\_Conf](#)) and a user request ComM\_RequestComMode(<user>, COMM\_FULL\_COMMUNICATION) or the DCM indicate ComM\_DCM\_ActiveDiagnostic(<channel>)([ComM873](#)), the timer for ComMTMinFullComModeDuration([ComM557\\_Conf](#)) shall be cancelled.」()

**[ComM889]** 「In sub-state COMM\_FULL\_COM\_NETWORK\_REQUESTED and configuration parameter ComMNmVariant=LIGHT|NONE ([ComM568\\_Conf](#)) and timer for ComMTMinFullComModeDuration([ComM557\\_Conf](#)) has expired and no user request ComM\_RequestComMode(<user>, COMM\_FULL\_COMMUNICATION) and the DCM does not indicate ComM\_DCM\_ActiveDiagnostic(<channel>)([ComM873](#)), the ComM channel state machine shall switch to sub-state COMM\_FULL\_COM\_READY\_SLEEP.」()

*Rationale for [ComM889](#):* As long as timer for ComMTMinFullComModeDuration has not expired the sub-state shall be kept, to prevent toggling.

**[ComM888]** 「In sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and configuration parameter `ComNMVariant=FULL | PASSIVE` ([ComM568\\_Conf](#)) and no user request `ComM_RequestComMode(<user>, COMM_FULL_COMMUNICATION)` and the DCM does not indicate `ComM_DCM_ActiveDiagnostic(<channel>)` ([ComM873](#)), the ComM channel state machine shall switch to sub-state `COMM_FULL_COM_READY_SLEEP.()`

*Rationale for [ComM888](#):* No timer needed if AUTOSAR NM is used. This avoids redundant functionality because AUTOSAR NM also ensures this functionality

**[ComM890]** 「In sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and the DCM does not indicate `ComM_DCM_ActiveDiagnostic(<channel>)` ([ComM873](#)) and communication limitation is requested (see section 7.3.2), ComM channel state machine shall immediately switch to sub-state `COMM_FULL_COM_READY_SLEEP.()`

**[ComM900]** 「In sub-state `COMM_FULL_COM_NETWORK_REQUESTED` and configuration parameter `ComNMVariant=PASSIVE` ([ComM568\\_Conf](#)) and the Network Manager module indicates `ComM_Nm_PrepareBusSleepMode()` ([ComM391](#)), the ComM channel state machine shall switch to state `COMM_SILENT_COMMUNICATION.()`

*Rationale for [ComM900](#):* If configuration parameter `ComNMVariant=PASSIVE`, a communication channel can be shutdown without user releasing the channel.

**7.2.3.2 COMM\_FULL\_COM\_READY\_SLEEP sub-state**

**[ComM133]** 「On entering sub-state COMM\_FULL\_COM\_READY\_SLEEP and configuration parameter ComMNmVariant=FULL ([ComM568\\_Conf](#)), the ComM module shall request Nm\_NetworkRelease( ) from the Network Management for the corresponding NM channels.」()

**[ComM891]** 「On entering sub-state COMM\_FULL\_COM\_READY\_SLEEP and configuration parameter ComMNmVariant=LIGHT ([ComM568\\_Conf](#)), the timer for ComMNmLightTimeout ([ComM606\\_Conf](#)) shall be started.」()

**[ComM299]** 「In sub-state COMM\_FULL\_COM\_READY\_SLEEP and configuration parameter ComMNmVariant=[FULL|PASSIVE] ([ComM568\\_Conf](#)) and the Network Manager module indicates ComM\_Nm\_PrepareBusSleepMode( ) ([ComM391](#)), the ComM channel state machine shall switch to state COMM\_SILENT\_COMMUNICATION.」()

**[ComM610]** 「In sub-state COMM\_FULL\_COM\_READY\_SLEEP and configuration parameter ComMNmVariant=LIGHT ([ComM568\\_Conf](#)) and the timer for ComMNmLightTimeout ([ComM606\\_Conf](#)) has expired, the ComM channel state machine shall switch to state COMM\_NO\_COMMUNICATION.」()

**[ComM671]** 「In sub-state COMM\_FULL\_COM\_READY\_SLEEP and configuration parameter ComMBusType=COMM\_BUS\_TYPE\_INTERNAL ([ComM567\\_Conf](#)), the ComM channel state machine shall immediately switch to state COMM\_NO\_COMMUNICATION.」()

**[ComM882]** 「In sub-state COMM\_FULL\_COM\_READY\_SLEEP and a user request COMM\_FULL\_COMMUNICATION and communication limitation is disabled (see Section 7.3.2), the ComM channel state machine shall immediately switch to sub-state COMM\_FULL\_COM\_NETWORK\_REQUESTED.」()

**[ComM883]** 「In sub-state COMM\_FULL\_COM\_READY\_SLEEP and DCM indicate ComM\_DCM\_ActiveDiagnostic([ComM873](#)), the ComM channel state

machine shall switch to sub-state

COMM\_FULL\_COM\_NETWORK\_REQUESTED.」()

*Rationale for [ComM883](#):* A potential communication limitation (see Section 7.3.2) shall temporarily be inactive during an active diagnostic session, see [ComM182](#)

[ComM892] 「In sub-state COMM\_FULL\_COM\_READY\_SLEEP and configuration parameter ComMNmVariant=LIGHT ([ComM568\\_Conf](#)) and a switch to sub-state COMM\_FULL\_COM\_NETWORK\_REQUESTED, due to request for COMM\_FULL\_COMMUNICATION according to requirements in [ComM882](#) or [ComM883](#), the timer for ComMNmLightTimeout ([ComM606\\_Conf](#)) shall be canceled.」()

## 7.3 Extended functionality

[ComM470] 「The extended functionality described in this chapter shall be individually configurable during runtime per feature (e.g. enable wake up inhibition but disable limitation to no communication).」()

*Rationale for [ComM470](#):* During runtime a change in the inhibition / limitation strategy is required in order to cope with changing conditions.

Use Case: Change the wakeup inhibition via diagnostics.

*Comment:* Configurable with parameter ComMEcuGroupClassification (see [ComM563\\_Conf](#)).

### 7.3.1 State duration extensions

*Comment:* Obsolete section and can be removed. Requirement for “state duration extension” for NM variant LIGHT and NONE, moved to state-machine section.

### 7.3.2 Communication inhibition

Note: The purpose of mode inhibition is to limit the communication capabilities. For details see Section 7.3.2.1 and Section 7.3.2.2.

**[ComM301]** 「The ComM module shall offer interfaces to request and release the corresponding mode inhibitions.」()

*Comment:* The ComM module doesn't care about who requests the mode inhibition but it is not a "normal" SW-C. It is a privileged SW-C or an OEM specific BSW.

**[ComM488]** 「It shall be possible to enable and disable the mode inhibition for each channel (channel state machine) independently. This functionality shall not be used by the ComM module itself.」()

**[ComM839]** 「The ComM module shall store the status of the user requests.」()

*Comment:* ComM839 describes the desired behaviour during an active mode limitation.

**[ComM840]** 「The ComM module shall store the updated status of the user requests if a user releases a request during an active mode inhibition.」()

*Rationale for [ComM840](#):* User requests shall be granted if the inhibition gets disabled.

*Comment:* Amount of active user requests from different users. ComM840 describes the desired behaviour during an active mode limitation.

**[ComM182]** 「The communication inhibition shall get temporarily inactive during an active diagnostic session.」()

*Rationale for [ComM182](#):* ECUs must not fall asleep during an active diagnostic session.

*Comment:* The DCM indicates the start of an active diagnostic session with `ComM_DCM_ActiveDiagnostic(<channel>)` ([ComM873](#)) and the end of a diagnostic session with `ComM_DCM_ActiveDiagnostic(<channel>)` ([ComM874](#)).

### 7.3.2.1 Bus wake up inhibition

*Information:* Bus wake up inhibition in context of the ComM module means that the ComM module should take precautions against awaking other ECUs by starting the communication.

*Rationale:* Awaking other ECUs by communication should be avoided because it is assumed that the ECU wakes up the bus because of an error (e.g. broken sensor).

*Use Case:* An error was detected on signal path of an active wake up line and this non reliable wake-up-source should not be able to awake the whole system anymore. An SW-C that controls error-reactions could set the wake up inhibition-status of related communication channels that usually get communication-requests from SW-Cs as the consequence of this event. This corrupts the forwarding of communication system-wide, based on unreliable wake up events. Or in case of application-specific system control, there is an SW-C that should switch off forwarding system wide wake up's by communication under conditions like e.g. transport mode.

**[ComM302]** «Bus wake up Inhibition shall be performed by ignoring user requests.» (BSW09089)

*Comment:* Ignoring user requests means accepting the requests but not executing them due to mode inhibition. The “highest win” strategy would apply immediately as soon as mode inhibition is switched off (see [ComM839](#) and [ComM840](#)).

**[ComM218]** «A communication request (COMM\_FULL\_COMMUNICATION) by a user shall be inhibited if the ComM Inhibition status is equal to `ComMNoWakeUp=TRUE` ([ComM569\\_Conf](#)) for the corresponding channel

and the current state of the channel is `COMM_NO_COMMUNICATION` or `COMM_SILENT_COMMUNICATION` .」()

*Rationale for [ComM218](#):* The inhibition should not get active, if the inhibition-status is set but the communication channel is already active.

**[ComM219]** 「The inhibition shall not get active if the current communication state is `COMM_FULL_COMMUNICATION` .」()

*Rationale for [ComM219](#):* The bus is already awake if the current communication state is `COMM_FULL_COMMUNICATION`.

**[ComM066]** 「The ComM module shall never inhibit the “passive wake-up” capability.」()

*Rationale for [ComM066](#):* It must be always possible to react on bus wake ups indicated by the EcuM module.

*Comment:* Reception is switched off in `COMM_NO_COMMUNICATION` mode but the wake up capability is switched on.

**[ComM157]** 「Inhibition status must be stored non volatile.」()

*Rationale for [ComM157](#):* Information must be available during start-up, before the communication is active (“Full Communication” mode entered). Changing or query is only possible after start-up with active communication (usually the “master”, who decides if the inhibition is active or not, is not on the same ECU).

**[ComM625]** 「The status of the user requests shall also be updated if a user releases a request.」()

### 7.3.2.2 Limit to COMM\_NO\_COMMUNICATION mode

**[ComM303]** 「The ComM module shall perform the limit to

COMM\_NO\_COMMUNICATION mode by switching to

COMM\_FULL\_COM\_READY\_SLEEP state to initiate a shutdown despite user requests for COMM\_FULL\_COMMUNICATION mode and ignoring new

COMM\_FULL\_COMMUNICATION mode requests.」(BSW09071)

*Rationale for [ComM303](#):* Forcing into COMM\_NO\_COMMUNICATION mode is needed to shut down software components, which keeps the bus awake.

**[ComM841]** 「The ComM module shall only perform the limit to

COMM\_NO\_COMMUNICATION mode if the current state is

COMM\_FULL\_COM\_NETWORK\_REQUESTED.」()

**[ComM842]** 「The ComM module shall ignore requests in other states than

COMM\_FULL\_COM\_NETWORK\_REQUESTED.」()

**[ComM215]** 「All active user requests for communication channel X shall be ignored if the ComM Inhibition ComMNoCom=TRUE (see

[ComM561\\_ConfComM571\\_Conf](#)) for the corresponding channel to

guarantee entering the COMM\_NO\_COMMUNICATION state for channel X.」()

**[ComM582]** 「The ComM module shall clear the user requests after all the channels that belong to the corresponding user enter COMM\_NO\_COMMUNICATION mode.」()

*Rationale for [ComM582](#):* Stored (faulty) user requests, which are assumed to keep the bus awake, must be cleared.

*Description:* The ComM module shall reload the default value of the ComM inhibition status from ComMNoCom (see [ComM571\\_Conf](#)) during initialization.

*Comment:* The current ComM inhibition status for each channel shall not be stored persistently. ComM582 describes the desired behaviour after an executed mode limitation.

## 7.4 Bus communication management

[ComM402] «The ComM module shall use the corresponding interfaces of the Bus State Manager modules to control the communication capabilities.»()

[ComM664] «The ComM module shall omit calls to control the communication capabilities if configuration parameter  
ComMBusType=COMM\_BUS\_TYPE\_INTERNAL  
([ComM567\\_Conf](#)).»(BSW09168)

*Rationale for [ComM664](#):* Internal communication has no corresponding bus interface.

## 7.5 Network management dependencies

[ComM599] «The ComM module shall support the shutdown synchronization variants (configured with ComMNmVariant, see [ComM568\\_Conf](#)) LIGHT, PASSIVE and FULL described in Table 3.»()

*Comment:* Only variant FULL and PASSIVE guarantees a synchronized shutdown between all nodes of a network. Note that since the NmIf cannot start the synchronized shutdown of coordinated networks before all networks are ready to go to sleep, requests from ComM to NmIf to release network communication on such a coordinated bus will be considered, but not always acted on directly. The NmIf will still answer with NM\_E\_OK, but network will not be released until all coordinated networks are ready to go to sleep.

NM variant	Keep bus awake capability	Shutdown synchronization
NONE		No shutdown synchronization by ComM. Shutdown by switching off the power of the ECU.
LIGHT		Shutdown synchronization by ComM with means of a timeout (configured with ComMNmLightTimeout, <a href="#">ComM606_Conf</a> )
PASSIVE	ECU is not allowed to keep the bus awake	Shutdown synchronization by ComM with means of AUTOSAR NM.
FULL	ECU is allowed to keep the bus awake.	Shutdown synchronization by ComM with means of AUTOSAR NM.

Table 3: Network management variants supported by the Communication Manager Module

*Comment:* A synchronized shutdown is not possible with the `LIGHT` variant thus the ECU may continuously restart ("toggle") because of a message from a node shutting down later.

**[ComM602]** «The ComM module shall omit calls of NM services if configuration parameter `ComNMVariant=LIGHT|NONE` (see [ComM568\\_Conf](#)).»()

*Rationale for [ComM602](#):* NM services are not available if no NM is available.

**[ComM667]** «The ComM module shall omit to call `Nm_NetworkRequest()` from NM if configuration parameter `ComNMVariant=PASSIVE` (see [ComM568\\_Conf](#)).»()

*Rationale for [ComM667](#):* Service `Nm_NetworkRequest()` is not available.

## 7.6 Bus error management

### 7.6.1 Network Start Indication

**[ComM583]** «The ComM module shall switch channel X to `COMM_FULL_COMMUNICATION` if NM indicates `ComM_Nm_NetworkStartIndication(<channel X>)`.»()

*Use Case for [ComM583](#):* A node sends an NM message in "Prepare Bus Sleep" state but other nodes are already in "Bus Sleep" state because of "race conditions".

## 7.7 Test support requirements

### 7.7.1 Inhibited Full Communication Request Counter

**[ComM138]** «The ComM module shall provide one Inhibit counter for all rejected COMM\_FULL\_COMMUNICATION mode requests. It shall count user requests, which cannot be fulfilled because the system has inhibited communication modes.»(BSW09155)

*Rationale for [ComM138](#):* The counter is used for detecting latent software problems related to unmotivated communication bus wake ups.

**[ComM140]** «The Inhibit counter ([ComM138](#)) for all rejected COMM\_FULL\_COMMUNICATION mode requests shall be stored in non-volatile memory.»()

**[ComM141]** «The range of the Inhibit counter ([ComM138](#)) for all rejected COMM\_FULL\_COMMUNICATION mode requests shall be 0 to 65535.»()

**[ComM142]** «The Inhibit counter ([ComM138](#)) for all rejected COMM\_FULL\_COMMUNICATION mode requests shall stop to increment if the maximum counter value is reached.»()

**[ComM143]** «It shall be possible to read out and reset the Inhibit counter ([ComM138](#)) for all rejected COMM\_FULL\_COMMUNICATION mode requests value by a ComM module API call.»()

*Use Case for [ComM143](#):* It shall be possible to read out and reset the current status of the counter by a diagnostic service.

## 7.8 Error classification

**[ComM509]** «Development error values are of type uint8.»()

**[ComM234]** «The ComM module shall use the error codes of table 4 to report errors.

Type or error	Relevance	Related error code	Value [hex]
API service used without module initialization	Development	COMM_E_NOT_INITED	0x1
API service used with wrong parameters (e.g. a NULL pointer)	Development	COMM_E_WRONG_PARAMETERS	0x2

Table 4: Error classification (BSW00323, BSW00327, BSW00337, BSW00385, BSW00386)

**[ComM612]** If not initialized, the ComM module shall reject every API service apart from `ComM_Init()` (see [ComM146](#)); the called function shall not be executed. )()

**[ComM858]** If not initialized, the ComM module shall report a development error `COMM_E_NOT_INITED` (see by using the `Det_ReportError` service of the Development Error Tracer module, if development error detection has been switched on by `ComMDevErrorDetect.` )()

## 7.9 Error detection

The detection of development errors is configurable (*ON* / *OFF*) at pre-compile time.

**[ComM511]** The switch `ComMDevErrorDetect` (see [ComM555\\_Conf](#)) shall activate or deactivate the detection of all development errors (see Table 4). )()

**[ComM512]** If the `ComMDevErrorDetect` switch (see [ComM555\\_Conf](#)) is enabled API parameter checking is enabled. )()

The detailed description of the detected errors can be found in chapter 7.8 and chapter 8.

## 7.10 Error notification

**[ComM270]** If the pre-processor switch `ComMDevErrorDetect` is set (see [ComM555\\_Conf](#)), the Communication Manager Module shall report detected development errors to the `Det_ReportError` service of the Development Error Tracer. (BSW00338)

## 7.11 Debugging support

**[ComM850]** 「Each variable that shall be accessible by AUTOSAR Debugging shall be defined as global variable.」()

**[ComM851]** 「Variables available for debugging shall be described in the respective Basic Software Module Description.」()

## 7.12 Non functional requirements

**[ComM459]** 「It shall be possible to integrate the ComM module delivered as source or object code into the AUTOSAR stack.

Rationale:

- Allow IP protection and guaranteed test coverage: object code
- Allow high efficiency and configurability at system generation time (by integrator): source code.」(BSW00342)

**[ComM462]** 「The ComM module shall be implemented according the AUTOSAR Software Module Design Requirements (for details refer to AUTOSAR General Requirements on Basic Software Modules [3]).」(BSW006, BSW007, BSW00300, BSW00301, BSW00302, BSW00305, BSW00306, BSW00307, BSW00308, BSW00309, BSW00310, BSW00312, BSW00329, BSW00328, BSW00330, BSW00347, BSW00371)

## 7.13 Version checking

**[ComM473]** 「The ComM module shall perform Inter Module Checks to avoid integration of incompatible files. The imported included files shall be checked by preprocessing directives.

The following version numbers shall be verified:

- <MODULENAME>\_AR\_RELEASE\_MAJOR\_VERSION
- <MODULENAME>\_AR\_RELEASE\_MINOR\_VERSION

Where <MODULENAME> is the Module Abbreviation of the other (external) modules which provide header files included by the ComM module.

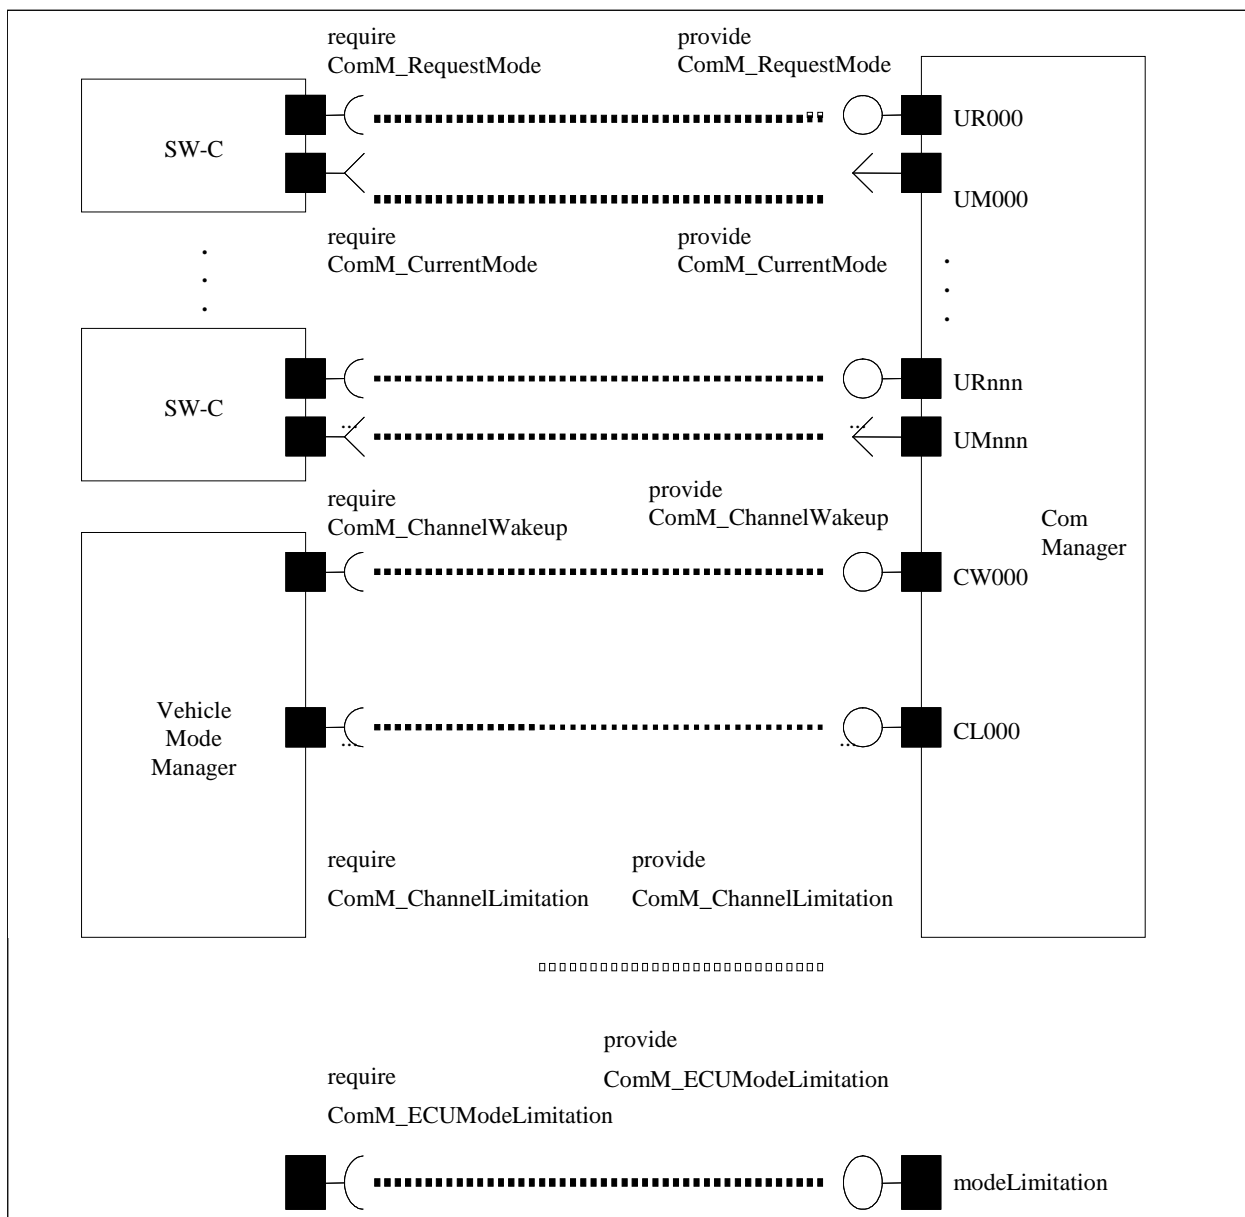

If the values are not identical to the expected values, an error shall be reported.」()

## 7.14 Communication Manager Module Services

This section defines the AUTOSAR Interfaces of the Communication Manager Module Service (ComM).

### 7.14.1 Architecture

The overall architecture of the Communication Manager Module service is depicted in Figure 5:

**Figure 5: ARPackage of the Communication Manager Module**

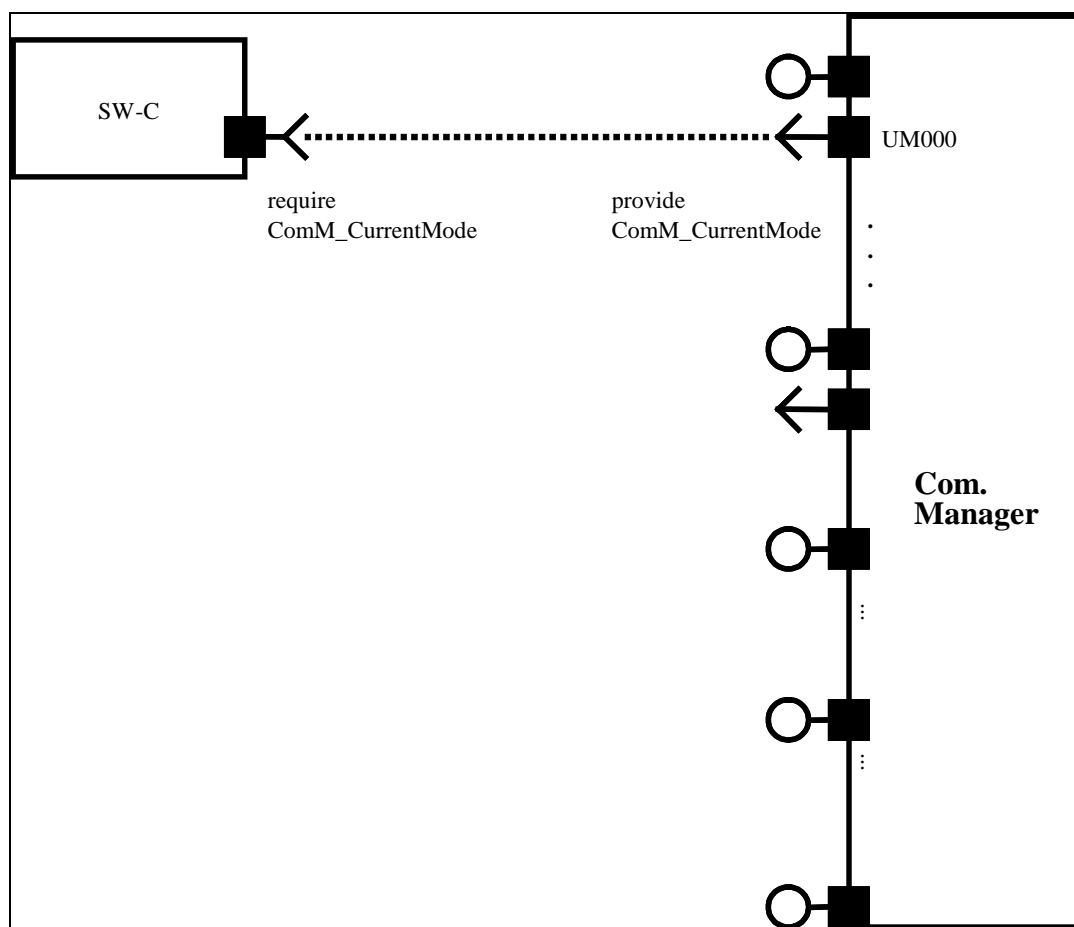

## 7.14.2 Use Cases

### 7.14.2.1 SW-Cs does not care about the ComM module at all

A SW-C that does not care about the Communication Manager Module will not require any of the interfaces defined in the ARPackage of the Communication Manager Module.

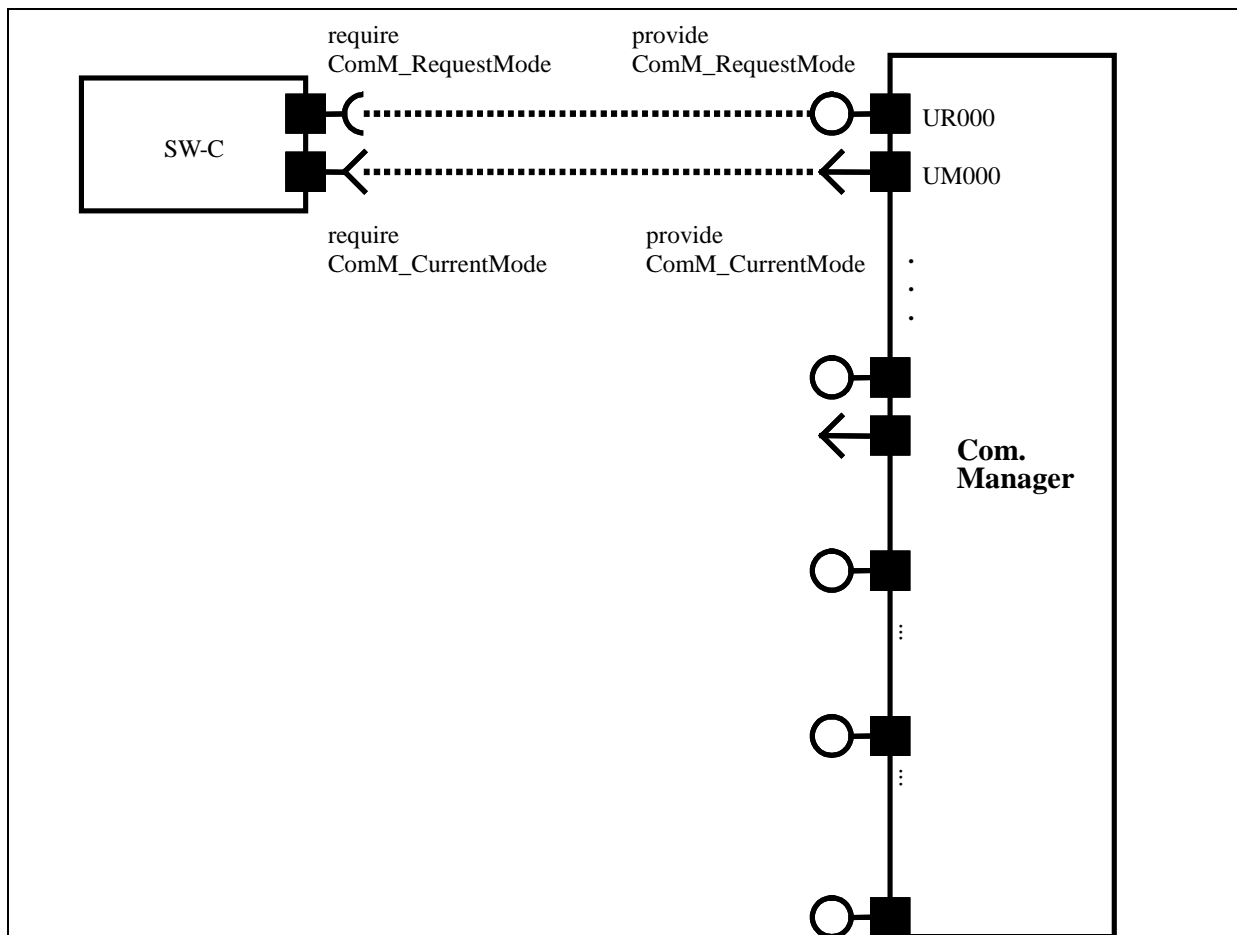

### 7.14.2.2 SW-Cs only cares about the state of its communication system

In this use case, a SW-C wants to know what communication capabilities it has (expressed by a communication mode 'none', 'silent' or 'full' - see ComM\_ModeType). The SW-C finds out about that by defining a port requiring the Interface ComM\_GetCurrentComMode. Depending on the available communication capabilities, the SW-C can specify that certain runnables of the SW-C should be executed or not. The Communication Manager Module must be configured correctly (with e.g. the physical channels that this SW-C uses for its logical communication) such that it has a port that provides this information about the current communication mode to the SW-C.

**Figure 6: SW-C requests state changes to the Communication Manager Module**

### 7.14.2.3 SW-Cs explicitly wants to take influence on its communication state

**Figure 7: SW-C requires state changes within the Communication Manager Module and reads out current communication state**

In this use case, the SW-C wants to explicitly take influence on the communication-state of the physical channels it needs. The SW-C indicates this by a specific port. Through this port, the SW-C can then request the Communication Manager Module mode “No Communication” or “Full Communication”. The Communication Manager Module will use these calls to request the corresponding communication mode from the corresponding Bus State Manager module.

**[ComM848]** «The Communication Manager Module shall provide an AUTOSAR port to allow the request of an communication mode by calling ‘ComM\_RequestComMode’ (see [ComM110](#)).»()

For a SW-C using the “direct API” of the RTE, the SW-C could for example do the following:

```

MySW-C_Runnable_Init(self)
{
    // SW-C wants to send and receive data
    e = Rte_Call_comRequest_RequestComMode(COMM_FULL_COMMUNICATION);
}
    
```

```

if (e == RTE_E_OK)
{
    // successfully requested the Com Manager Module to move to
    // full communication mode
}
else
{
    // an error occurred when
    // interacting with the Com Manager module
    if (e == E_MODE_LIMITATION)
    {
        // a current ComMMode limitation forbids going into
        // that mode;
        // let's ask what the maximal allowed ComMMode is
        Rte_Call_comRequest_GetMaxComMode(&max);
        if (max==COMM_NO_COMMUNICATION)
        {
            ...
        };
    }
    else
    {
        // a more serious error occurred ...
    };
};
...
};

MySW-C_Runnable_Loop(self)
{
    if (status == ready_to_sleep)
    {
        //no need to send; ready for shutdown communication
        Rte_Call_comRequest_RequestComMode(COMM_NO_COMMUNICATION);
        ...
    };
};

```

*Comment:* Note that these APIs do not require that the SW-C has knowledge of the channels that it needs.

#### 7.14.2.4 SW-C wants to interact directly with physical channels activate ECU Mode Limitation

The SW-C shall request mode from BswM. BswM will handle the direct communication with ComM.

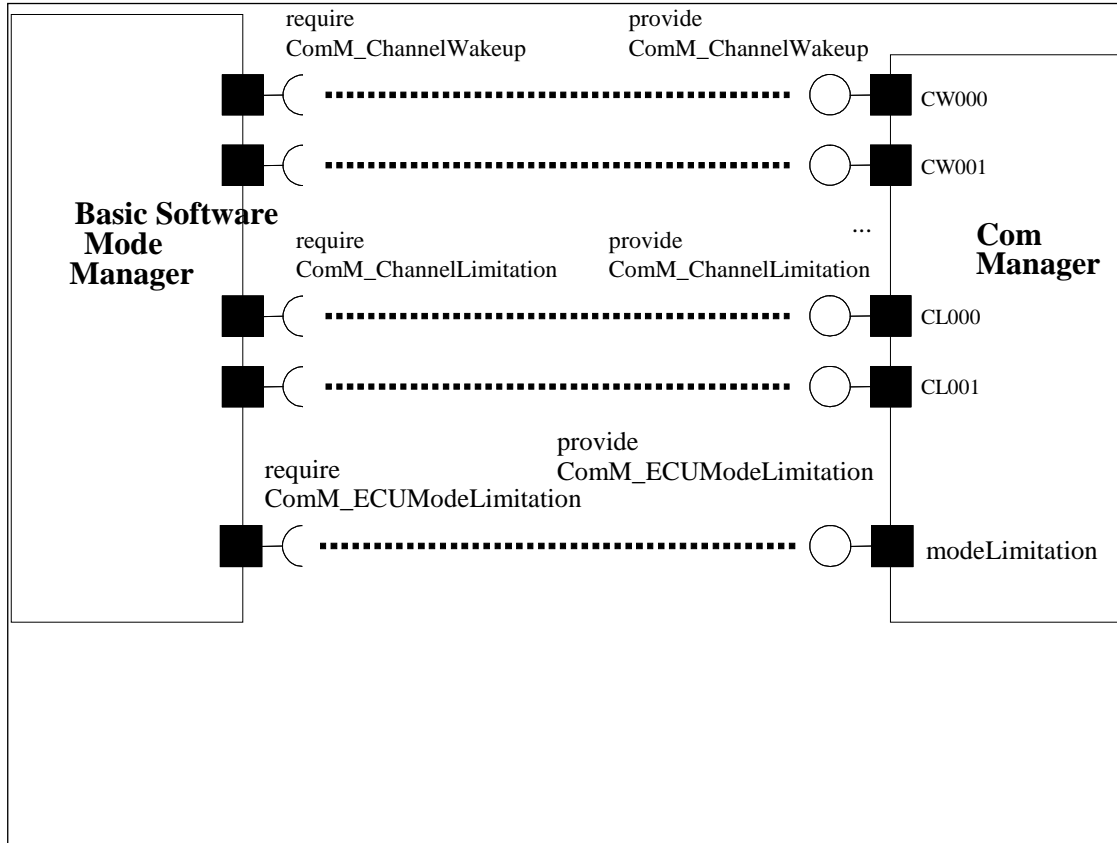

Figure 8: Interaction between BswM and the ComM module

### 7.14.3 Specification of Ports and Port Interfaces

This section specifies the Port Interfaces that are needed to operate the Communication Manager Module functionality over the RTE.

#### 7.14.3.1 Types used by the interfaces

```

ImplementationDataType ComM_ModeType
{
    ImplementationDataType {LOWER-LIMIT=0, UPPER-LIMIT=2};
    // 0 -> COMM_NO_COMMUNICATION
    // 1 -> COMM_SILENT_COMMUNICATION
    // 2 -> COMM_FULL_COMMUNICATION
};

ModeDeclarationGroup ComMMode
{
    {
        COMM_NO_COMMUNICATION,
        COMM_SILENT_COMMUNICATION,
        COMM_FULL_COMMUNICATION
    }
    initialMode = COMM_NO_COMMUNICATION
}

ImplementationDataType ComM_InhibitionStatusType
{
    //bit 0: wake up inhibition active

```

```
        //bit 1: limit to "silent comm"  
    };
```

### 7.14.3.2 Ports and Port Interface for User Requests

#### 7.14.3.2.1 General Approach

A SW-C that wants to explicitly direct the local Communication Manager Module of the ECU towards a certain state requires the client-server interface `ComM_UserRequest`. Through this interface the SW-C can set the desired state of all communication channels that are relevant for that component, to "No Communication" or "Full Communication". In order to keep the SW-Cs code independent from the values of the handles that are used to identify the user towards the Communication Manager Module, these handles are not passed from the SW-C to the Communication Manager Module. Rather they are modeled as "port defined argument values" of the Provide Ports on the Communication Manager Module's side. As a consequence, these handles do not show up as arguments in the operations of the client-server interface `ComM_UserRequest`. As a further consequence of this approach, the Communication Manager Module has a separate port for each user.

#### 7.14.3.2.2 Data Types

No data types are needed for this interface.

#### 7.14.3.2.3 Port interface `ComM_UserRequest`

```
ClientServerInterface ComM_UserRequest  
{  
    PossibleErrors  
    {  
        //an internal execution error occurred  
        E_NOT_OK = 1,  
  
        //ComMMode cannot be granted because of ComMMode inhibition  
        E_MODE_LIMITATION = 2  
    };  
  
    // The SW-C requests that all communication channels it needs are in  
    // the provided Communication Manager Module mode:  
    RequestComMode(IN ComM_ModeType ComMode,  
                   ERR{E_NOT_OK, E_MODE_LIMITATION});  
  
    // Returns the current Communication Manager Module mode for the SW-C:  
    GetCurrentComMode(OUT ComM_ModeType ComMode, ERR{E_NOT_OK});  
  
    // Returns the maximal allowed Communication Manager Module Mode  
    GetMaxComMode(OUT ComM_ModeType ComMode, ERR{E_NOT_OK});  
  
    // Returns that last Communication Manager Module Mode requested by  
    // the SW-C  
    GetRequestedComMode(OUT ComM_ModeType ComMode, ERR{E_NOT_OK});  
};
```

### 7.14.3.3 Ports and Port Interfaces for the current mode of the Communication Manager Module

#### 7.14.3.3.1 General approach

**[ComM847]** «The Communication Manager Module shall have an AUTOSAR port providing the sender-receiver interface 'ComM\_CurrentMode'.»()

**[ComM733]** «The Communication Manager Module shall have a separate port providing the sender-receiver interface 'ComM\_CurrentMode' for each configured user, to which a SW-C is connected. »()

A SW-C that wants to get informed about its current Communication Manager Module Mode requires the sender-receiver interface ComM\_CurrentMode.

#### 7.14.3.3.2 Port interface ComM\_CurrentMode

```
ModeSwitchInterface ComM_CurrentMode
{
    ComMMode currentMode;
};
```

### 7.14.3.4 Ports and Port Interfaces for the ComM users currently requesting FULL\_COMM

#### 7.14.3.4.1 General approach

**[ComM734]** «The Communication Manager Module shall have an optional (see **ComM787\_Conf**) separate port providing the sender-receiver interface 'ComM\_CurrentChannelRequest' for each configured ComM channel.»()

Rationale for ComM734: A SW-C that wants to get informed about, which users are currently requesting FULL\_COMM requires the sender-receiver interface ComM\_CurrentChannelRequest'.

**[ComM736]** «Whenever the set of ComM users currently requesting FULL\_COMM for a channel changes, the Communication Manager Module shall update the data element fullComRequestors. A change shall update the data element only, when the Communication Manager Module accepts the communication request of the ComM user.»()

Rationale for Com736: Requests rejected because of active ModeLimitations will not lead to an update of the data element.

#### 7.14.3.4.2 Data Types

[ComM906] ⌈

```
ImplementationDataType ComM_UserHandleArrayType
{
    // This element contains the number of valid user handle entries in
    // the "handleArray" member. If no user keeps the channel requested,
    // this is zero
    ImplementationDataType numberOfRequesters {LOWER-LIMIT=0, UPPER-
    LIMIT= MAX_CHANNEL_REQUESTER };

    // This element contains the user handles of the users which keep the
    // channel requested (if any), starting in its first entries. The
    // size of the array MAX_CHANNEL_REQUESTERS is the maximum of the
    // number of users requesting a channel.
    ComM_UserHandleType handleArray[];
}
⌋()
```

#### 7.14.3.4.3 Port Interface ComM\_CurrentChannelRequest

ComM904

```
SenderReceiverInterface ComM_CurrentChannelRequest
{
    // Array of ComMUserIdentifier, that currently hold FULL_COM
    // requests for this channel. The size of the attribute
    // fullComRequestors.handleArray is NUM_COMM_USER_PER_CHANNEL
    ComM_UserHandleArrayType fullComRequestors;
}
```

### 7.14.3.5 Ports and Port Interface for ECU Mode Limitation

#### 7.14.3.5.1 General approach

[ComM740] ⌈The Communication Manager Module can be configured to have an AUTOSAR port providing the client-server interface ComM\_ECUModeLimitation.⌋()

A SW-C, which plays the role of a “Mode Manager”, can use this interface to change the behaviour of the entire ECU.

#### 7.14.3.5.2 Port interface ComM\_ECUModeLimitation

**[ComM741]** ⌈

```

ClientServerInterface ComM_ECUModeLimitation
{
    PossibleErrors
    {
        E_NOT_OK = 1 //an internal execution error occurred
    };

    // enables (status==true) or disables (status==false)
    // the 'no communication' Communication Manager Module Mode
    LimitECUToNoComMode(IN boolean Status, ERR{E_NOT_OK});

    // returns the value of the 'inhibited full communication
    // request counter'
    ReadInhibitCounter(OUT uint16 CounterValue,ERR{E_NOT_OK});

    //reset the "inhibited full communication request counter"
    ResetInhibitCounter(ERR{E_NOT_OK});

    //changes the ECU group classification status
    SetECUGroupClassification(IN ComM_InhibitionStatusType Status,
                              ERR{E_NOT_OK});
};⌋()

```

**7.14.3.6 Ports and Port Interface for Channel Wake up****7.14.3.6.1 General approach**

**[ComM747]** ⌈The Communication Manager Module can be configured to have an AUTOSAR port providing the Client-Server Interface ComM\_ChannelWakeup.⌋()

A SW-C playing the role of a “Mode Manager” can use this interface to configure the Communication Manager Module to take precautions against awaking other ECU's by starting the communication. In order to keep the SW-Cs code independent from the values of the handles that are used to identify a specific handle towards the Communication Manager Module, these handles are **not** passed from the SW-C to the Communication Manager Module. Rather they are modeled as “port defined argument values” of the Provide Ports on the Communication Manager Module's side. As a consequence, these handles do not show up as arguments in the operations of the client-server interface ComM\_ChannelWakeup. As a further consequence of this approach, the Communication Manager Module has separate ports for each channel.

**7.14.3.6.2 Port interface ComM\_ChannelWakeup****[ComM742]**

```

⌈
ClientServerInterface ComM_ChannelWakeup
{

```

```

PossibleErrors
{
    E_NOT_OK = 1 //an internal execution error occurred
};

// changes the inhibition status ComMNoWakeup
// (see ComM569\_Conf) for the channel
PreventWakeUp(IN boolean Status, ERR{E_NOT_OK});

//returns the inhibition status of a channel
GetInhibitionStatus(OUT ComM_InhibitionStatusType Status, ERR{E_NOT_OK});
};>()

```

### 7.14.3.7 Ports and Port Interface for interface Channel Limitation

#### 7.14.3.7.1 General approach

**[ComM752]** «The Communication Manager Module can be configured to have an AUTOSAR port providing the Client-Server Interface

`ComM_ChannelLimitation.()`

A SW-C playing the role of a “Mode Manager” can use this interface to configure the Communication Manager Module to inhibit communication mode for a given channel. In order to keep the SW-Cs code independent from the values of the handles that are used to identify a specific handle towards the Communication Manager Module, these handles are **not** passed from the SW-C to the Communication Manager Module. Rather they are modelled as “port defined argument values” of the Provide Ports on the Communication Manager Module side. As a consequence, these handles do not show up as arguments in the operations of the client-server interface `ComM_ChannelLimitation`. As a further consequence of this approach, the Communication Manager Module has separate ports for each channel.

#### 7.14.3.7.2 Port interface `ComM_ChannelLimitation`

**[ComM743]**

```

«
ClientServerInterface ComM_ChannelLimitation
{
    PossibleErrors
    {
        E_NOT_OK = 1 //an internal execution error occurred
    };

    // enables (status==TRUE) or disables (status==FALSE)
    // the limitation of the channel to “no communication”
    LimitChannelToNoComMode(IN boolean Status, ERR{E_NOT_OK});

    //returns the inhibition status of a channel
    GetInhibitionStatus(OUT ComM_InhibitionStatusType Status, ERR{E_NOT_OK});
}
»

```

```
} ;>()
```

### 7.14.3.8 Definition of the Service of the Communication Manager Module

This section provides guidance on the definition of the Communication Manager Module service. There are ports on both sides of the RTE. This description of the Communication Manager Module service defines the ports below the RTE. Each SW-C, which uses the Service, must contain “service ports” in its own SW-C description which will be connected to the ports of the COM Manager module, so that the RTE can be generated.

*Comment:* Note that these definitions can only be completed during ECU configuration (because it depends on certain configuration parameters of the Communication Manager Module, which determine the number of ports provided by the Communication Manager Module service). Also note that the implementation of an SW-C does *not* depend on these definitions.

#### [ComM744]

```
[
/* This is the definition of the Communication Manager Module as a service.
This is the 'outside-view' of the Communication Manager Module */
Service ComM
{
    // port present if ComMModeLimitationEnabled (see ComM560\_Conf)
    ProvidePort ComM_ECUModeLimitation modeLimitation;

    // port present for each channel
    // if ComMModeLimitationEnabled (see ComM560\_Conf);
    // there are NC channels;
    ProvidePort ComM_ChannelLimitation CL000;
    ...
    ProvidePort ComM_ChannelLimitation CL<NC-1>;

    // port present for each channel
    // if COMM_WAKEUP_INHIBITION_ENABLED (see ComM559\_Conf)
    ProvidePort ComM_ChannelWakeup CW000;
    ...
    ProvidePort ComM_ChannelWakeup CW<NC-1>;

    // For each user the Communication Manager Module provides 2 ports.
    // To facilitate configuration, the index of this user shall
    // correspond to the index in the array COMM_USER_LIST used for the
    // configuration of the Communication Manager Module (see ComM562).
    // The number of users must correspond to the size of this array.
    ProvidePort ComM_UserRequest UR000;    // (see 7.14.3.2.2)
    ProvidePort ComM_CurrentMode UM000;
    ProvidePort ComM_UserRequest UR001;    //(see 7.14.3.2.2)
    ProvidePort ComM_CurrentMode UM001;
    ...
    ProvidePort ComM_UserRequest UR<COMM_USER_LIST.size-1>;
    ProvidePort ComM_CurrentMode UM<COMM_USER_LIST.size-1>;

    // port present for each channel if configured
    // (see ComM787_Conf)
    // there are NC channels;
```

```

ProvidePort ComM_CurrentChannelRequest CR000;
...
ProvidePort ComM_CurrentChannelRequest CR<NC-1>;

};>()

```

## 7.14.4 Runnables and Entry points

### 7.14.4.1 Internal behaviour

This is the inside description of the Communication Manager Module. This detailed description is only needed for the configuration of the local RTE.

#### [ComM745]

```

[
InternalBehavior of the Communication Manager Module
{
    // Runnable entities of the Communication Manager Module
    RunnableEntity LimitECUToNoComMode
        symbol "ComM_LimitECUToNoComMode" /* see ComM124 */
        canbeInvokedConcurrently = FALSE

    RunnableEntity ReadInhibitCounter
        symbol "ComM_ReadInhibitCounter" /* see ComM224 */
        canbeInvokedConcurrently = FALSE

    RunnableEntity ResetInhibitCounter
        symbol "ComM_ResetInhibitCounter" /* see ComM108 */
        canbeInvokedConcurrently = FALSE

    RunnableEntity SetECUGroupClassification
        symbol "ComM_SetECUGroupClassification" /* see ComM552 */
        canbeInvokedConcurrently = FALSE

    RunnableEntity LimitChannelToNoComMode
        symbol "ComM_LimitChannelToNoComMode" /* see ComM163 */
        canbeInvokedConcurrently = FALSE

    RunnableEntity GetInhibitionStatus
        symbol "ComM_GetInhibitionStatus" /*see ComM619 */
        canbeInvokedConcurrently = FALSE

    RunnableEntity PreventWakeup
        symbol "ComM_PreventWakeup"
        canbeInvokedConcurrently = FALSE

    RunnableEntity RequestComMode
        symbol "ComM_RequestComMode" /* see ComM110 */
        canbeInvokedConcurrently = TRUE

    RunnableEntity GetMaxComMode
        symbol "ComM_GetMaxComMode" /* see ComM085 */
        canbeInvokedConcurrently = TRUE
}
]

```

```

RunnableEntity GetRequestedComMode
    symbol "ComM_GetRequestedComMode"
    canBeInvokedConcurrently = TRUE

RunnableEntity GetCurrentComMode
    symbol "ComM_GetCurrentComMode" /*see ComM083 */
    canBeInvokedConcurrently = TRUE

// the following applies if ComMModeLimitationEnabled
// (see ComM560\_Conf)
modeLimitation.LimitECUToNoComMode -> LimitECUToNoComMode
modeLimitation.ReadInhibitCounter -> ReadInhibitCounter
modeLimitation.ResetInhibitCounter -> ResetInhibitCounter
modeLimitation.SetECUGroupClassification -> SetECUGroupClassification

// per-channel behaviour only present
// if ComMModeLimitationEnabled (see ComM560\_Conf)
// there are NC channels
// To facilitate configuration, the names of the channels correspond
// to the index of the channel in the "Channel" container used to
// configure the Communication Manager Module
CL000.LimitChannelToNoComMode -> LimitChannelToNoComMode
CL000.GetInhibitionStatus -> GetInhibitionStatus
PortArgument {port=CL000,
               value.type= ComM_UserhandleType,
               value.value=Channel[0].COMM_CHANNEL_ID}

...
CLnnn.LimitChannelToNoComMode -> LimitChannelToNoComMode
CLnnn.GetInhibitionStatus -> GetInhibitionStatus
PortArgument {port=CLnnn,
               value.type= ComM_UserhandleType,
               value.value=Channel[nnn].COMM_CHANNEL_ID}

// per-channel behaviour only present
// if COMM_WAKEUP_INHIBITION_ENABLED (see ComM559\_Conf)
CW000.preventWakeUp -> PreventWakeUp
PortArgument {port=CW000,
               value.type= ComM_UserhandleType,
               value.value=Channel[0].COMM_CHANNEL_ID}

...
CWnnn.preventWakeUp -> PreventWakeUp
PortArgument {port=CWnnn,
               value.type= ComM_UserhandleType,
               value.value=Channel[nnn].COMM_CHANNEL_ID}

// per-user behaviour
// Note that the port-argument value must be consistent with the
// value in the configuration COMM_USER_LIST
// Note that the exact data-type of the UserHandleType must of course
// be defined BEFORE RTE_configuration, but does NOT affect the
// API seen by the SW-Cs that use the service
UR000.RequestComMode -> RequestComMode
UR000.GetMaxComMode -> GetMaxComMode
UR000.GetRequestedComMode -> GetRequestedComMode
UR000.GetCurrentComMode -> GetCurrentComMode
PortArgument {port=UR000,
               value.type= ComM_UserhandleType,
               value.value=COMM_USER_LIST[0]}

...
URnnn.RequestComMode -> RequestComMode
URnnn.GetMaxComMode -> GetMaxComMode

```

```
URnnn.GetRequestedComMode -> GetRequestedComMode
URnnn.GetCurrentComMode -> GetCurrentComMode
PortArgument {port=URnnn,
               value.type= ComM_UserhandleType,
               value.value=COMM_USER_LIST[n]}
};
```

Comment: 'modeLimitation.LimitECUToNoComMode -> LimitECUToNoComMode' is supposed to define an OperationInvokedEvent that links the OperationPrototype to the runnable entity that is supposed to be executed.

#### **7.14.4.2 Header file to be included by the Communication Manager Module**

The RTE deals with the Communication Manager Module as with any normal SW-C. The RTE will be able to generate a header-file based on the internal-behaviour description of the Communication Manager Module which contains for instance a definition of the API's (like `Rte_Ports_CurrentMode_P`) which are available to the Communication Manager Module. This implies that an implementation of the Communication Manager Module must include this generated header-file.

## 8 API specification

### 8.1 Imported types

#### 8.1.1 Standard types

In this chapter all types included from the following files are listed:

[ComM820] 「

Header file	Imported Type
Std_Types.h	Std_VersionInfoType
	Std_ReturnType
ComStack_Types.h	NetworkHandleType
	PNCHandleType
NvM_Types.h	NvM_BlockIdType
Nm_Types.h	Nm_ReturnType

」(BSW00348, BSW00357)

[ComM649] 「The Std\_ReturnType shall be extended with the following #define values:

#define	Value	Description
COMM_E_MODE_LIMITATION	0x02	Function call has been successfully but mode can not be granted because of mode inhibition.
COMM_E_UNINIT	0x03	ComM not initialized

」(BSW00331, BSW00369, BSW00377, BSW00441)

### 8.2 Type definitions

[ComM863] 「The following Data Types shall be used for the functions defined in this Specification.」(BSW00441)

#### 8.2.1 ComM\_InitStatusType

<b>Name:</b>	ComM_InitStatusType	
<b>Type:</b>	Enumeration	
<b>Range:</b>	COMM_UNINIT	The COM Manager is not initialized or not usable. This shall be the default value after reset. This status shall have the value 0.
	COMM_INIT	The COM Manager is initialized and usable.
<b>Description:</b>	Initialization status of ComM.	

## 8.2.2 ComM\_InhibitionStatusType

<b>Name:</b>	ComM_InhibitionStatusType		
<b>Type:</b>	uint8		
<b>Range:</b>	InhibitionStatusRange	--	Defines whether a mode inhibition is active or not. Bit 0 (LSB): Wake Up inhibition active Bit 1: Limit to COMM_FULL_COMMUNICATION mode
<b>Description:</b>	Inhibition status of ComM.  e.g. status=00000011 -> Wake up inhibition and limitation to COMM_FULL_COMMUNICATION mode active		

## 8.2.3 ComM\_UserHandleType

<b>Name:</b>	ComM_UserHandleType		
<b>Type:</b>	uint8		
<b>Description:</b>	Handle to identify a user. For each user, a unique value must be defined at system generation time. Maximum number of users is 255. Legal user IDs are in the range 0 .. 254; user ID 255 is reserved and shall have the symbolic representation COMM_NOT_USED_USER_ID.		

*Comment:* This handle has local scope for only one ECU.

## 8.2.4 ComM\_ModeType

<b>Name:</b>	ComM_ModeType		
<b>Type:</b>	uint8		
<b>Range:</b>	COMM_NO_COMMUNICATION	0	ComM state machine is in "No Communication" mode. Configured channel shall have no transmission or reception capability.
	COMM_SILENT_COMMUNICATION	1	ComM state machine is in "Silent Communication" mode. Configured channel shall have only reception capability, no transmission capability.
	COMM_FULL_COMMUNICATION	2	ComM state machine is in "Full Communication" mode. Configured channel shall have both transmission and reception capability.
<b>Description:</b>	Current mode of the Communication Manager (main state of the state machine).		

## 8.2.5 ComM\_PncModeType

<b>Name:</b>	ComM_PncModeType		
<b>Type:</b>	Enumeration		

<b>Range:</b>	PNC_REQUESTED	PNC is requested by a local ComM user
	PNC_READY_SLEEP	PNC is requested by a remote ComM user
	PNC_PREPARE_SLEEP	PNC is active with no deadline monitoring
	PNC_NO_COMMUNICATION	PNC does not communicate
	PNC_FULL_COMMUNICATION	PNC is able to communicate
<b>Description:</b>	Current mode of a PNC	

## 8.2.6 ComM\_StateType

<b>Name:</b>	ComM_StateType		
<b>Type:</b>	uint8		
<b>Range:</b>	COMM_NO_COM_NO_PENDING_REQUEST	0	--
	COMM_NO_COM_REQUEST_PENDING	1	--
	COMM_FULL_COM_NETWORK_REQUESTED	2	--
	COMM_FULL_COM_READY_SLEEP	3	--
	COMM_SILENT_COM	4	--
<b>Description:</b>	State and sub-state of ComM state machine  ComM states vs. Communication Modes: COMM_NO_COM* : Communication Mode='No Communication' COMM_FULL_COM*: Communication Mode='Full Communication' COMM_SILENT_COM: Communicatio Mode='Silent Communication'		

## 8.3 Function definitions

This is a list of functions provided for upper layer modules.

### 8.3.1 ComM\_Init

[ComM146]

[

<b>Service name:</b>	ComM_Init
<b>Syntax:</b>	void ComM_Init( void )
<b>Service ID[hex]:</b>	0x01
<b>Sync/Async:</b>	Synchronous
<b>Reentrancy:</b>	Non Reentrant
<b>Parameters (in):</b>	None
<b>Parameters (inout):</b>	None
<b>Parameters (out):</b>	None
<b>Return value:</b>	None
<b>Description:</b>	Initializes the AUTOSAR Communication Manager and restarts the internal state machines.

](BSW101, BSW00358, BSW00414)

**[ComM793]** 「Caveats of `ComM_Init()`: The NVRAM Manager module has to be initialized to have the possibility to "direct" access the ComM module's parameters.」()

**[ComM864]** 「In `ComM_Init()` ComM shall read non-volatile parameters specified in [ComM103](#) from NVRAM. If no parameters are available, ComM shall use the default values in the ComM configuration.」()

### 8.3.2 ComM\_DeInit

**[ComM147]**

「

<b>Service name:</b>	ComM_DeInit
<b>Syntax:</b>	void ComM_DeInit( void )
<b>Service ID[hex]:</b>	0x02
<b>Sync/Async:</b>	Synchronous
<b>Reentrancy:</b>	Non Reentrant
<b>Parameters (in):</b>	None
<b>Parameters (inout):</b>	None
<b>Parameters (out):</b>	None
<b>Return value:</b>	None
<b>Description:</b>	This API de-initializes the AUTOSAR Communication Manager.

」(BSW00336)

**[ComM794]** 「De-initialization in `ComM_DeInit()` shall only be performed if all channels controlled by the ComM module are in `COMM_NO_COMMUNICATION` mode.

*Rationale for [ComM794](#):* Since the `ComM_DeInit()` API cannot return an error message, it must be assured that all channels are in `COMM_NO_COMMUNICATION` mode and `COMM_NO_COM_NO_PENDING_REQUEST` sub-state before `ComM_DeInit()` is called. E.g. the state should be checked with `ComM_GetState(Channel, ...)` and `ComM_CommunicationAllowed(Channel, TRUE)` cannot be called before `ComM_DeInit()` has been called.」()

**[ComM865]** 「In `ComM_DeInit` ComM shall store non-volatile parameters specified in [ComM103](#) to NVRAM.」()

### 8.3.3 ComM\_GetState

[ComM872]

<b>Service name:</b>	ComM_GetState	
<b>Syntax:</b>	Std_ReturnType ComM_GetState( NetworkHandleType Channel, ComM_StateType* State )	
<b>Service ID[hex]:</b>	0x34	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	Channel	The Network Channel for the requested state of ComM state machine.
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	State	State of the ComM channel state machine: COMM_NO_COM_NO_PENDING_REQUEST COMM_NO_COM_REQUEST_PENDING COMM_FULL_COM_NETWORK_REQUESTED COMM_FULL_COM_READY_SLEEP COMM_SILENT_COM
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully return current state of ComM state machine E_NOT_OK: Return of current state of ComM state machine failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	<p>Return current state, including sub-state, of the ComM channel state machine.</p> <p>Usage of function only valid if EcuM/Fixed is used: To leave RUN: state/sub-state need to be COMM_NO_COM_NO_PENDING_REQUEST (No communication and no pending request to start communication) In POST RUN to return to RUN: state/sub-state need to be in COMM_NO_COM_REQUEST_PENDING (No communication, but a pending request to start communication)</p> <p>If EcuM/Flex and BswM is used, BswM instead use received mode indications from ComM (BswM_ComM_RequestedMode(..)).</p>	

」()

### 8.3.4 ComM\_GetStatus

[ComM242]

<b>Service name:</b>	ComM_GetStatus	
<b>Syntax:</b>	Std_ReturnType ComM_GetStatus( ComM_InitStatusType* Status )	

	)	
<b>Service ID[hex]:</b>	0x03	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	None	
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	Status	COMM_UNINIT: The ComM is not initialized or not usable. Default value after startup or after ComM_DelInit() is called. COMM_INIT: The ComM is initialized and usable.
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully return of initialization status E_NOT_OK: Return of initialization status failed
<b>Description:</b>	Returns the initialization status of the AUTOSAR Communication Manager. After a call to ComM_DelInit() ComM should have status COMM_UNINIT, and a new call to ComM_Init needed to make sure ComM restart internal state machines to default values.	

](BSW00406)

### 8.3.5 ComM\_GetInhibitionStatus

[ComM619]

[

<b>Service name:</b>	ComM_GetInhibitionStatus	
<b>Syntax:</b>	Std_ReturnType ComM_GetInhibitionStatus( NetworkHandleType Channel, ComM_InhibitionStatusType* Status )	
<b>Service ID[hex]:</b>	0x04	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	Channel	See NetworkHandleType
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	Status	See ComM_InhibitionStatusType
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully returned Inhibition Status E_NOT_OK: Return of Inhibition Status failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	Returns the inhibition status of a ComM channel.	

)]()

### 8.3.6 ComM\_RequestComMode

[ComM110]

[

<b>Service name:</b>	ComM_RequestComMode	
<b>Syntax:</b>	Std_ReturnType ComM_RequestComMode( ComM_UserHandleType User, ComM_ModeType ComMode )	
<b>Service ID[hex]:</b>	0x05	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Reentrant	

<b>Parameters (in):</b>	User	Handle of the user who requests a mode
	ComMode	COMM_FULL_COMMUNICATION COMM_NO_COMMUNICATION
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully changed to the new mode E_NOT_OK: Changing to the new mode failed COMM_E_MODE_LIMITATION: Mode can not be granted because of mode inhibition. COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	Requesting of a Communication Mode by a user.  Note: Internally mode COMM_SILENT_COMMUNICATION is not a valid request for a user, mode used for synchronization at shutdown. Valid modes are COMM_NO_COMMUNICATION and COMM_FULL_COMMUNICATION	

」(BSW09081)

**[ComM795]** 「Configuration of ComM\_RequestComMode: Relationship between users and channels. A user is statically mapped to one or more channels.」()

### 8.3.7 ComM\_GetMaxComMode

**[ComM085]**

「

<b>Service name:</b>	ComM_GetMaxComMode	
<b>Syntax:</b>	Std_ReturnType ComM_GetMaxComMode( ComM_UserHandleType User, ComM_ModeType* ComMode )	
<b>Service ID[hex]:</b>	0x06	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Reentrant	
<b>Parameters (in):</b>	User	Handle of the user who requests a mode
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	ComMode	See ComM_ModeType
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully returned maximum allowed Communication Mode E_NOT_OK: Return of maximum allowed Communication Mode failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	Function to query the maximum allowed Communication Mode of the corresponding user.	

」()

**Use Case:** This function provides the possibility to request the maximum possible mode (e.g. user requests "Silent Communication" mode and wants to check if it is possible to get "Full Communication" mode or if a limitation/inhibition is active). This is needed for diagnosis/debugging.

**[ComM374]** 「If more than one channel is linked to one user request and the maximum allowed modes of the channels are different, then the function ComM\_GetMaxComMode shall return the lowest mode (see [ComM867](#) and [ComM868](#)).」()

**[ComM796]** 「Configuration of ComM\_GetMaxComMode: Relationship between users and channels. A user is statically mapped to one or more channels.」()

### 8.3.8 ComM\_GetRequestedComMode

**[ComM079]**

「

<b>Service name:</b>	ComM_GetRequestedComMode	
<b>Syntax:</b>	Std_ReturnType ComM_GetRequestedComMode( ComM_UserHandleType User, ComM_ModeType* ComMode )	
<b>Service ID[hex]:</b>	0x07	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Reentrant	
<b>Parameters (in):</b>	User	Handle of the user who requests a mode
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	ComMode	Name of the requested mode
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully returned requested Communication Mode E_NOT_OK: Return of requested Communication Mode failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	Function to query the currently requested Communication Mode of the corresponding user.	

」(BSW09149)

*Rationale for ComM079:* The requested user "Communication Mode" has to be stored volatile within the Communication Manager Module itself, to prevent redundant storage of status information by the users.

*Comment:* If the Communication Manager Module would not have this service every user has to store the status on its own --> redundant and possibly inconsistent storage of the same data.

**ComM797:** Configuration of ComM\_GetRequestedComMode: Relationship between users and channels. A user is statically mapped to one or more channels.

### 8.3.9 ComM\_GetCurrentComMode

**[ComM083]**

[

<b>Service name:</b>	ComM_GetCurrentComMode	
<b>Syntax:</b>	Std_ReturnType ComM_GetCurrentComMode( ComM_UserHandleType User, ComM_ModeType* ComMode )	
<b>Service ID[hex]:</b>	0x08	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Reentrant	
<b>Parameters (in):</b>	User	Handle of the user who requests a mode
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	ComMode	See ComM_ModeType
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully returned Communication Mode from Bus State Manager E_NOT_OK: Return of Communication Mode from Bus State Manager failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	Function to query the current Communication Mode. ComM shall use the corresponding interfaces of the Bus State Managers to get the current Communication Mode of the network. (Call to Bus State Manager API: XXXSM_GetCurrentComMode(...))	

](BSW09084)

**[ComM176]** [ If more than one channel is linked to one user request and the modes of the channels are different, the function ComM\_GetCurrentComMode shall return the lowest mode (see [ComM867](#) and [ComM868](#)). ](BSW09172)

**[ComM798]** [ Configuration of ComM\_GetCurrentComMode: Relationship between users and channels. A user is statically mapped to one or more channels. ]()

### 8.3.10 ComM\_PreventWakeUp

**[ComM156]**

[

<b>Service name:</b>	ComM_PreventWakeUp	
<b>Syntax:</b>	Std_ReturnType ComM_PreventWakeUp( NetworkHandleType Channel, boolean Status )	
<b>Service ID[hex]:</b>	0x09	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	Channel	See NetworkHandleType
	Status	FALSE: Wake up inhibition is switched off TRUE: Wake up inhibition is switched on
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	

<b>Return value:</b>	Std_ReturnType	E_OK: Successfully changed wake up status for the channel E_NOT_OK: Changed of wake up status for the channel failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	Changes the inhibition status COMM_NO_WAKEUP for the corresponding channel.	

」(BSW09157)

**[ComM799]** 「Configuration of ComM\_PreventWakeUp: Configurable with COMM\_WAKEUP\_INHIBITION\_ENABLED (see [ComM559\\_Conf](#)).」()

### 8.3.11 ComM\_LimitChannelToNoComMode

**[ComM163]**

「

<b>Service name:</b>	ComM_LimitChannelToNoComMode	
<b>Syntax:</b>	Std_ReturnType ComM_LimitChannelToNoComMode( NetworkHandleType Channel, boolean Status )	
<b>Service ID[hex]:</b>	0x0b	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	Channel	See NetworkHandleType
	Status	FALSE: Limit channel to COMM_NO_COMMUNICATION disabled TRUE: Limit channel to COMM_NO_COMMUNICATION enabled
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully changed inhibition status for the channel E_NOT_OK: Changed of inhibition status for the channel failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	Changes the inhibition status for the channel for changing from COMM_NO_COMMUNICATION to a higher Communication Mode. (See also ComM_LimitECUToNoComMode, same functionality but for all channels)	

」(BSW09157)

**[ComM800]** 「Configuration of ComM\_LimitChannelToNoComMode: Configurable with ComMModeLimitationEnabled (see [ComM560\\_Conf](#)) and COMM\_RESET\_AFTER\_FORCING\_NO\_COMM (see [ComM558\\_Conf](#)).」()

### 8.3.12 ComM\_LimitECUToNoComMode

**[ComM124]**

「

<b>Service name:</b>	ComM_LimitECUToNoComMode
----------------------	--------------------------

<b>Syntax:</b>	Std_ReturnType ComM_LimitECUToNoComMode( boolean Status )	
<b>Service ID[hex]:</b>	0x0c	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	Status	FALSE: Limit ECU to COMM_NO_COMMUNICATION disabled TRUE: Limit ECU to COMM_NO_COMMUNICATION enabled
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully changed inhibition status for the ECU E_NOT_OK: Changed of inhibition status for the ECU failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	Changes the inhibition status for the ECU (=all channels) for changing from COMM_NO_COMMUNICATION to a higher Communication Mode. (See also ComM_LimitChannelToNoComMode, same functionality but for a specific channels)	

」(BSW09157)

**[ComM801]** 「 Configuration of ComM\_LimitECUToNoComMode: Configurable with ComMModeLimitationEnabled (see [ComM560 Conf](#)) and COMM\_RESET\_AFTER\_FORCING\_NO\_COMM (see [ComM558 Conf](#)). 」()

### 8.3.13 ComM\_ReadInhibitCounter

**[ComM224]**

「

<b>Service name:</b>	ComM_ReadInhibitCounter	
<b>Syntax:</b>	Std_ReturnType ComM_ReadInhibitCounter( uint16* CounterValue )	
<b>Service ID[hex]:</b>	0x0d	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	None	
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	CounterValue	Amount of rejected COMM_FULL_COMMUNICATION user requests.
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully returned Inhibition Counter E_NOT_OK: Return of Inhibition Counter failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	This function returns the amount of rejected COMM_FULL_COMMUNICATION user requests.	

」(BSW09156)

**[ComM802]** 「Configuration of ComM\_ReadInhibitCounter: Configurable with ComMModeLimitationEnabled (see [ComM560\\_Conf](#)). Function will only be available if ComMModeLimitationEnabled (see [ComM560\\_Conf](#)) is enabled.」()

### 8.3.14 ComM\_ResetInhibitCounter

**[ComM108]**

「

<b>Service name:</b>	ComM_ResetInhibitCounter	
<b>Syntax:</b>	Std_ReturnType ComM_ResetInhibitCounter( void )	
<b>Service ID[hex]:</b>	0x0e	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	None	
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	Std_ReturnType	E_OK: Successfully reset of Inhibit COMM_FULL_COMMUNICATION Counter E_NOT_OK: Reset of Inhibit COMM_FULL_COMMUNICATION Counter failed COMM_E_UNINIT: ComM not initialized
<b>Description:</b>	This function resets the Inhibited COMM_FULL_COMMUNICATION request Counter.	

」(BSW09156)

**[ComM803]** 「Configuration of ComM\_ResetInhibitCounter: Configurable with ComMModeLimitationEnabled (see [ComM560\\_Conf](#)). Function will only be available if ComMModeLimitationEnabled (see [ComM560\\_Conf](#)) is enabled.」()

### 8.3.15 ComM\_SetECUGroupClassification

**[ComM552]**

「

<b>Service name:</b>	ComM_SetECUGroupClassification	
<b>Syntax:</b>	Std_ReturnType ComM_SetECUGroupClassification( ComM_InhibitionStatusType Status )	
<b>Service ID[hex]:</b>	0x0f

<b>Reentrancy:</b>	Reentrant	
<b>Parameters (in):</b>	Channel	Channel
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	None	
<b>Description:</b>	Notification of a wake up on the corresponding channel.	

」()

[ComM814] 「Caveats of ComM\_EcuM\_WakeUpIndication: The Communication Manager Module is initialized correctly.」()

### 8.4.4 AUTOSAR ECU State Manager and Basic Software Mode Manager Interface

#### 8.4.4.1 ComM\_CommunicationAllowed

[ComM871]

「

<b>Service name:</b>	ComM_CommunicationAllowed	
<b>Syntax:</b>	void ComM_CommunicationAllowed( NetworkHandleType Channel, boolean Allowed )	
<b>Service ID[hex]:</b>	0x35	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	Channel	Channel
	Allowed	TRUE: Communication is allowed FALSE: Communication is not allowed
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	None	

<b>Description:</b>	EcuM or BswM shall indicate to ComM when communication is allowed. If EcuM/Fixed is used: EcuM/Fixed. If EcuM/Flex is used: BswM
---------------------	----------------------------------------------------------------------------------------------------------------------------------------

⌋()

## 8.4.5 Bus State Manager Interface

### 8.4.5.1 ComM\_BusSM\_ModeIndication

[ComM675]

⌈

<b>Service name:</b>	ComM_BusSM_ModeIndication	
<b>Syntax:</b>	void ComM_BusSM_ModeIndication( NetworkHandleType Channel, ComM_ModeType* ComMode )	
<b>Service ID[hex]:</b>	0x33	
<b>Sync/Async:</b>	Asynchronous	
<b>Reentrancy:</b>	Reentrant	
<b>Parameters (in):</b>	Channel	See NetworkHandleType
	ComMode	See ComM_ModeType
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	None	
<b>Description:</b>	Indication of the actual bus mode by the corresponding Bus State Manager. ComM shall propagate the indicated state to the users with means of the RTE and BswM.	

⌋()

[ComM816] ⌈ Caveats of ComM\_BusSM\_ModeIndication(...): The Communication Manager Module is initialized correctly. ⌋()

## 8.4.6 COM Interface

<b>Service name:</b>	ComM_COMCbk_<sn>	
<b>Syntax:</b>	void ComM_COMCbk_<sn>( void )	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant	
<b>Parameters (in):</b>	None	
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	None	

<b>Description:</b>	This callback is called when the EIRA or ERA was updated in COM. The call only informs the ComM about ERA and EIRA changes. The actual handling is done in the next ComM main task with changing the corresponding PN State machine.
---------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## 8.5 Scheduled functions

These functions are directly called by Basic Software Scheduler. The following functions shall have no return value and no parameter. All functions shall be non reentrant.

### 8.5.1 ComM\_MainFunction

[ComM429]

「

<b>Service name:</b>	ComM_MainFunction_<Channel_Id>
<b>Syntax:</b>	void ComM_MainFunction_<Channel_Id>( void )
<b>Service ID[hex]:</b>	0x60
<b>Timing:</b>	FIXED_CYCLIC
<b>Description:</b>	This function shall perform the processing of the AUTOSAR ComM activities that are not directly initiated by the calls e.g. from the RTE. There shall be one dedicated Main Function for each instance of ComM.  Precondition: ComM shall be initialized

」(BSW00373, BSW00376)

[ComM818] 「Configuration of ComM\_MainFunction\_<Channel\_Id>: See section 10.2.2.」()

## 8.6 Expected interfaces

In this chapter all interfaces required from other modules are shown. An overview of the required interfaces is shown in Figure 1.

### 8.6.1 Mandatory Interfaces

This chapter defines all interfaces which are required to fulfil the core functionality of the module.

[ComM828] 「

API function	Module	Description
Nm_PassiveStartUp	Nm	This function calls the <BusNm>_PassiveStartUp function (e.g.

		CanNm_PassiveStartUp function is called if channel is configured as CAN).
Nm_NetworkRequest	Nm	This function calls the <BusNm>_NetworkRequest (e.g. CanNm_NetworkRequest function is called if channel is configured as CAN).
Nm_NetworkRelease	Nm	This function calls the <BusNm>_NetworkRelease bus specific function (e.g. CanNm_NetworkRelease function is called if channel is configured as CAN).
Dcm_ComM_NoComModeEntered	Dcm	This call informs the Dcm module about a ComM mode change to COMM_NO_COMMUNICATION.
Dcm_ComM_SilentComModeEntered	Dcm	This call informs the Dcm module about a ComM mode change to COMM_SILENT_COMMUNICATION.
Dcm_ComM_FullComModeEntered	Dcm	This call informs the Dcm module about a ComM mode change to COMM_FULL_COMMUNICATION.
Rte_Ports_UserMode_P()[n].Switch_currentMode(RTE_MODE_ComMode_NO_COMMUNICATION)	Rte	Indicate COMM_NO_COMMUNICATION mode to RTE
Rte_Ports_UserMode_P()[n].Switch_currentMode(RTE_MODE_ComMode_SILENT_COMMUNICATION)	Rte	Indicate COMM_SILENT_COMMUNICATION mode to RTE
Rte_Ports_UserMode_P()[n].Switch_currentMode(RTE_MODE_ComMode_FULL_COMMUNICATION)	Rte	Indicate COMM_FULL_COMMUNICATION mode to RTE
BswM_ComM_CurrentMode	BswM	Indicate Communication Mode to BswM
NvM_ReadBlock	NvM	NVRAM manager API for Read block
NvM_WriteBlock	NvM	NVRAM manager API for Write block
NvM_GetErrorStatus	NvM	NVRAM manager API for Get status

」()

### 8.6.1.1 AUTOSAR NVRAM Manager module

**[ComM103]** 「The ComM module shall use the corresponding standardized services of the NVRAM Manager module (see [ComM828](#)) for storing and reading non-volatile configuration data ComMNoWakeup (see [ComM569\\_Conf](#)), ComMEcuGroupClassification(see [ComM563\\_Conf](#)), inhibition status (see [ComM157](#)) and the Inhibit counter (see [ComM140](#)).」()

*Comment:* See [ComM864](#) and [ComM865](#) when configuration data shall be read and stored

For details refer to the AUTOSAR NVRAM Manager module Specification [7].

### 8.6.1.2 AUTOSAR Network Management Interface

**[ComM261]** 「The ComM module shall use the corresponding functions to synchronize the bus start-up and shutdown of the Network Management (see [ComM828](#)).

For details refer to the AUTOSAR NM Interface Specification [9].」()

### 8.6.1.3 AUTOSAR Diagnostic Communication Manager Module

**[ComM266]** 「The ComM module shall use the corresponding functions provided by DCM (see ComM828) to control the communication capabilities of the DCM module.」()

*Comment:* DCM provides no functions to start/stop transmission and reception. DCM ensures to control communication according the indicated Communication Manager Module states.

**[ComM693]** 「If more than one channel is linked to one user request and the modes of the channels are different, the ComM module shall indicate the lowest Communication Mode to the DCM module.」()

For details refer to the AUTOSAR DCM Specification [11].

### 8.6.1.4 AUTOSAR RTE interface provided by RTE to ComM for the SW-C

**[ComM091]** 「The ComM module shall use the corresponding function provided by RTE to indicate modes to the users. There shall be one indication per user. Fan-out in case of a mode indication related to more than one user shall be done by the Communication Manager Module.」(BSW09085)

**[ComM663]** 「If more than one channel is linked to one user request and the modes of the channels are different, the ComM module shall indicate the lowest mode to the user.」()

**[ComM662]** 「The sequence of users shall start with user 0 up to user N and the name of the mode ports shall be UM000, UM001, ... UM<N>.」()

*Rationale for ComM662:* It shall be possible to use the port based API also to address specific users directly.

*Comment:* Within the array of ports, the ports are named alphabetically.

**[ComM778]** The ComM module shall explicitly indicate changes in modes to each individual user, to which a SW-C is connected. The ComM module shall do this by calling the right API on the RTE through the ports “UMnnn”.>()

*Comment:* There is one such port per configured user to which a SW-C is connected. For users not used by SW-Cs (e.g. the users created due to ComM840\_Conf :) no mode port will be created.

Implementation Hint: An implementation of the ComM module could use any of the normal RTE-mechanisms to signal changes in the mode to the users. Given the specific configurability of the Communication Manager Module, using the RTE “Indirect API” seems most appropriate. This works as follows (consult the RTE specification for details).

An implementation of the Communication Manager Module can use the “Rte\_Ports” API to obtain an array of the “UMnnn” ports at run-time.

```
/* Return an array of all ports that provide the interface ComM_CurrentMode.  
Because of the specific naming conventions chosen, the element n in this  
array of ports will reference to the port UM<nnn>. For example  
userModePorts[1] will be a handle on port UM001 */  
userModePorts = Rte_Ports_ComM_CurrentMode_P();
```

The number of such userModePorts can be obtained through the call  
Rte\_NPorts\_ComM\_CurrentMode\_P. This value corresponds to the size of  
the COMM\_USER\_LIST array.

To signal that a user n is in a new mode, the Communication Manager Module  
should: userModePorts[n].Switch\_currentMode(newMode)

For details refer to the AUTOSAR RTE specification [8] .

### 8.6.1.5 Basic Software Mode Manager (BswM)

**[ComM861]** The ComM module shall use the corresponding function provided by BswM to report the states of Communication Manager Module channels (see ComM828). »()

For details refer to AUTOSAR Basic Software Mode Manager module [29] .

### 8.6.2 Optional Interfaces

This chapter defines all interfaces which are required to fulfill an optional functionality of the module.

**[ComM829]** »

<i>API function</i>	<i>Module</i>	<i>Description</i>
Det_ReportError	Det	Service to report development errors
CanSM_RequestComMode	CanSM	
CanSM_GetCurrentComMode	CanSM	
LinSM_RequestComMode	LinSM	
LinSM_GetCurrentComMode	LinSM	
FrSM_RequestComMode	FrSM	
FrSM_GetCurrentComMode	FrSM	
EthSM_RequestComMode	EthSM	
EthSM_GetCurrentComMode	EthSM	
BswM_ComM_CurrentPNCMode	BswM	Function called by ComM to indicate the current mode of the PNC

»()

#### 8.6.2.1 AUTOSAR DET

The Communication Manager module shall use Det\_ReportError from the Development Error Tracer Module to report development errors.

#### 8.6.2.2 AUTOSAR CAN State Manager

**[ComM854]** If CAN is used, the ComM module shall use CanSM\_RequestComMode( ) from the CAN State Manager to request a dedicated communication mode. »()

**[ComM855]** The Communication Manager module shall use CanSM\_GetCurrentComMode( ) from the CAN State Manager to query the current communication mode if necessary. »()

When it is necessary to request a dedicated communication mode depends on the current status of each instance of the channel state machine (see above).

For details of the functionality of the CAN State Manager module refer to its Specification [24].

*Comment:* Those APIs can be called re-entrant, as long as different channel & controller numbers are used.

### 8.6.2.3 AUTOSAR LIN State Manager Module

**[ComM856]** The Communication Manager module shall use

`LinSM_RequestComMode()` from the LIN State Manager to request a dedicated communication mode. `⌋()`

**[ComM857]** The Communication Manager module shall use

`LinSM_GetCurrentComMode()` from the LIN State Manager to query the current communication mode if necessary. `⌋()`

When it is necessary to request a dedicated communication mode depends on the current status of each instance of the channel state machine (see above).

For details of the functionality of the LIN State Manager module refer to its Specification [23].

### 8.6.2.4 AUTOSAR FlexRay State Manager Module

**[ComM852]** The Communication Manager module shall use

`FrSM_RequestComMode()` from the FlexRay State Manager to request a dedicated communication mode. `⌋()`

**[ComM853]** The Communication Manager module shall use

`FrSM_GetCurrentComMode()` from the FlexRay State Manager to query the current communication mode if necessary. `⌋()`

When it is necessary to request a dedicated communication mode depends on the current status of each instance of the channel state machine (see above).

For details of the functionality of the FlexRay State Manager module refer to its Specification [25].

### 8.6.2.5 AUTOSAR Ethernet State Manager Module

**[ComM859]** 「The Communication Manager module shall use `EthSM_RequestComMode()` from the Ethernet State Manager to request a dedicated communication mode.」()

**[ComM860]** 「The Communication Manager module shall use `EthSM_GetCurrentComMode()` from the Ethernet State Manager to query the current communication mode if necessary.」()

When it is necessary to request a dedicated communication mode depends on the current status of each instance of the channel state machine (see above).

For details of the functionality of the Ethernet State Manager module refer to its Specification [28]

### 8.6.3 Configurable Interfaces

None.

### 8.6.4 AUTOSAR COM

<b>Service name:</b>	Com_SendSignal	
<b>Syntax:</b>	<pre>uint8 Com_SendSignal(     Com_SignalIdType SignalId,     const void* SignalDataPtr )</pre>	
<b>Service ID[hex]:</b>	0x0a	
<b>Sync/Async:</b>	Asynchronous	
<b>Reentrancy:</b>	Non Reentrant for the same signal. Reentrant for different signals.	
<b>Parameters (in):</b>	SignalId	Id of signal to be sent.
	SignalDataPtr	Reference to the signal data to be transmitted.
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	None	
<b>Return value:</b>	uint8	E_OK: service has been accepted COM_SERVICE_NOT_AVAILABLE: corresponding I-PDU group was stopped (or service failed due to development error) COM_BUSY: in case the TP-Buffer is locked for large data types handling
<b>Description:</b>	The service Com_SendSignal updates the signal object identified by SignalId with the signal referenced by the SignalDataPtr parameter.	

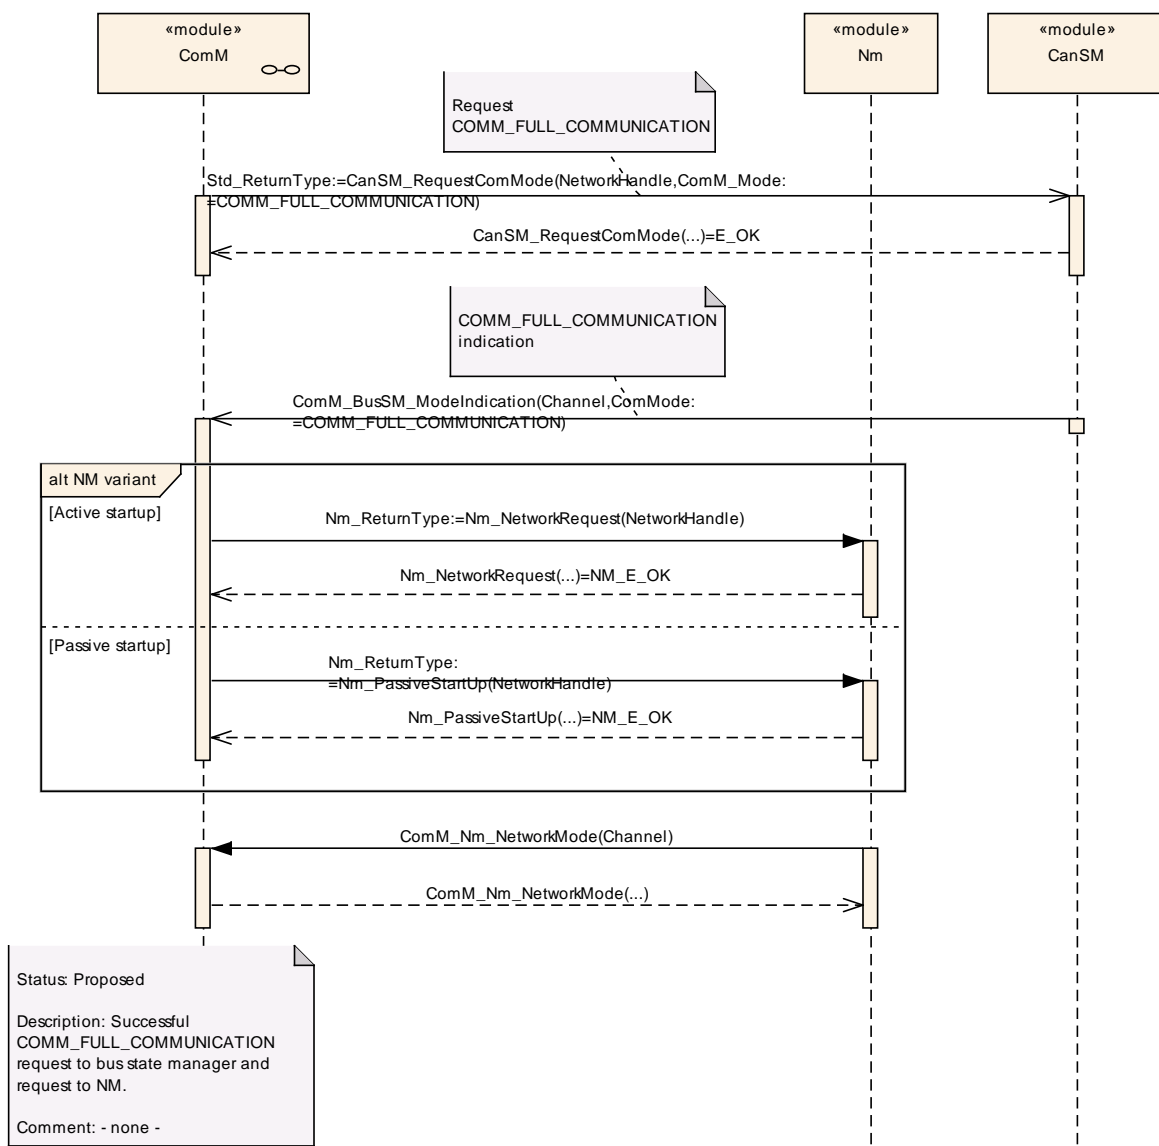

<b>Service name:</b>	Com_ReceiveSignal	
<b>Syntax:</b>	<pre>uint8 Com_ReceiveSignal(     Com_SignalIdType SignalId,     void* SignalDataPtr )</pre>	
<b>Service ID[hex]:</b>	0x0b	

<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant for the same signal. Reentrant for different signals.	
<b>Parameters (in):</b>	SignalId	Id of signal to be received.
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	SignalDataPtr	Reference to the location where the received signal data shall be stored
<b>Return value:</b>	uint8	E_OK: service has been accepted COM_SERVICE_NOT_AVAILABLE: corresponding I-PDU group was stopped (or service failed due to development error) COM_BUSY: in case the TP-Buffer is locked for large data types handling
<b>Description:</b>	Com_ReceiveSignal copies the data of the signal identified by SignalId to the location specified by SignalDataPtr.	

## 9 Sequence diagrams

### 9.1 Transmission and Reception start (CAN)

Figure 9 shows the sequence for starting transmission and reception on CAN. The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

**Figure 9: Starting transmission and reception on CAN**

## 9.2 Passive Wake-up (CAN)

Figure 10 shows the behaviour after a wake-up indicated by the ECU State Manager module, or the Nm module for a CAN channel. The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

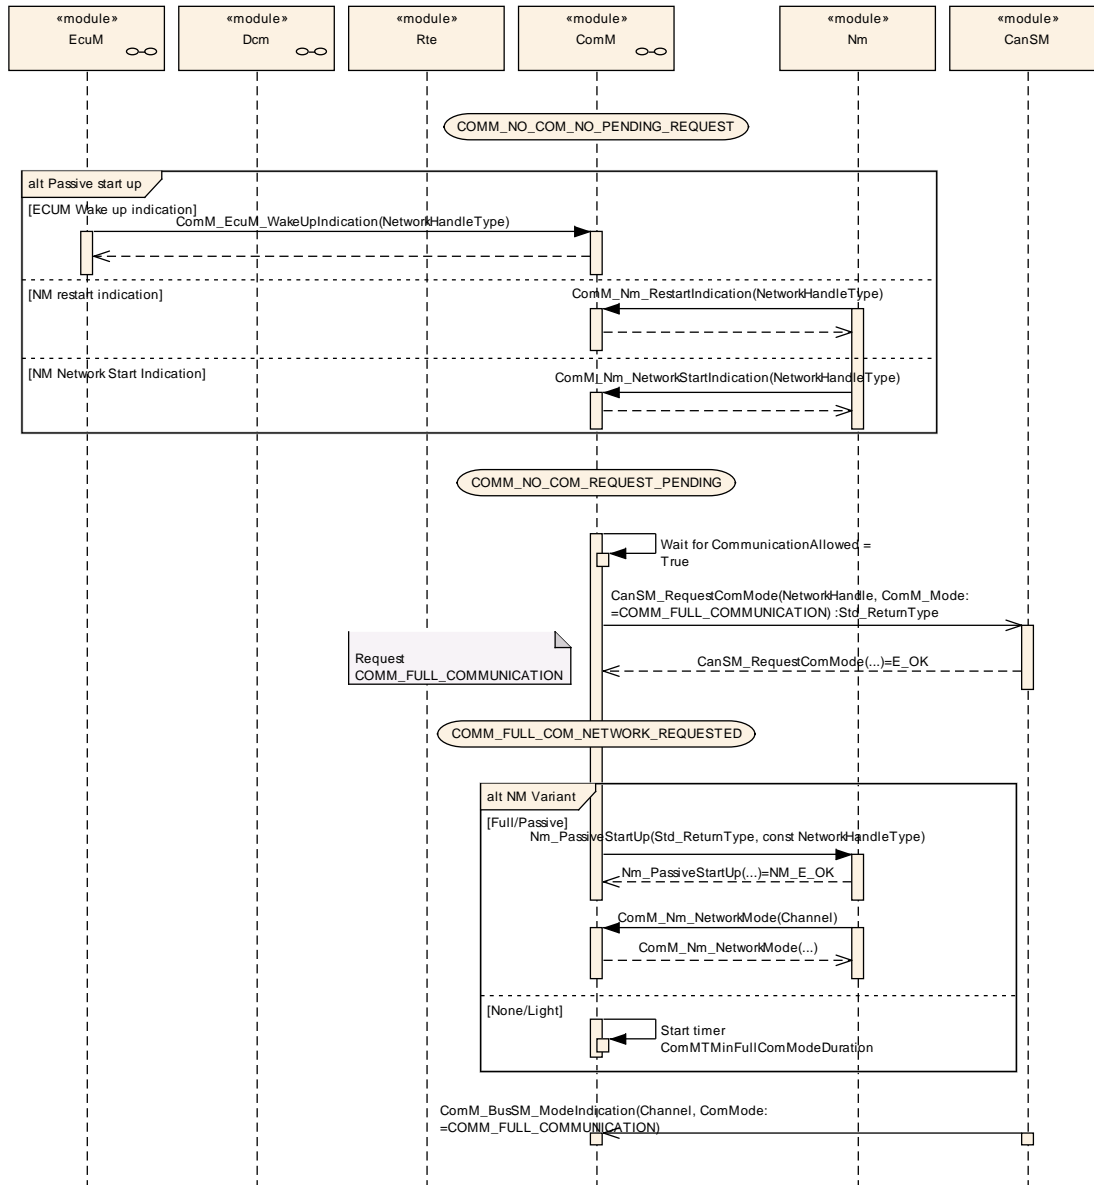

Figure 10: Reaction on a wake-up indicated by the ECU State Manager module

### 9.3 Network shutdown (CAN)

Figure 11 shows the possibilities to shutdown the CAN network. It can be either initiated if the last user releases his `COMM_FULL_COMMUNICATION` request or `ComM_LimitChannelToNoComMode(...)` (see [ComM163](#)) is called. The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

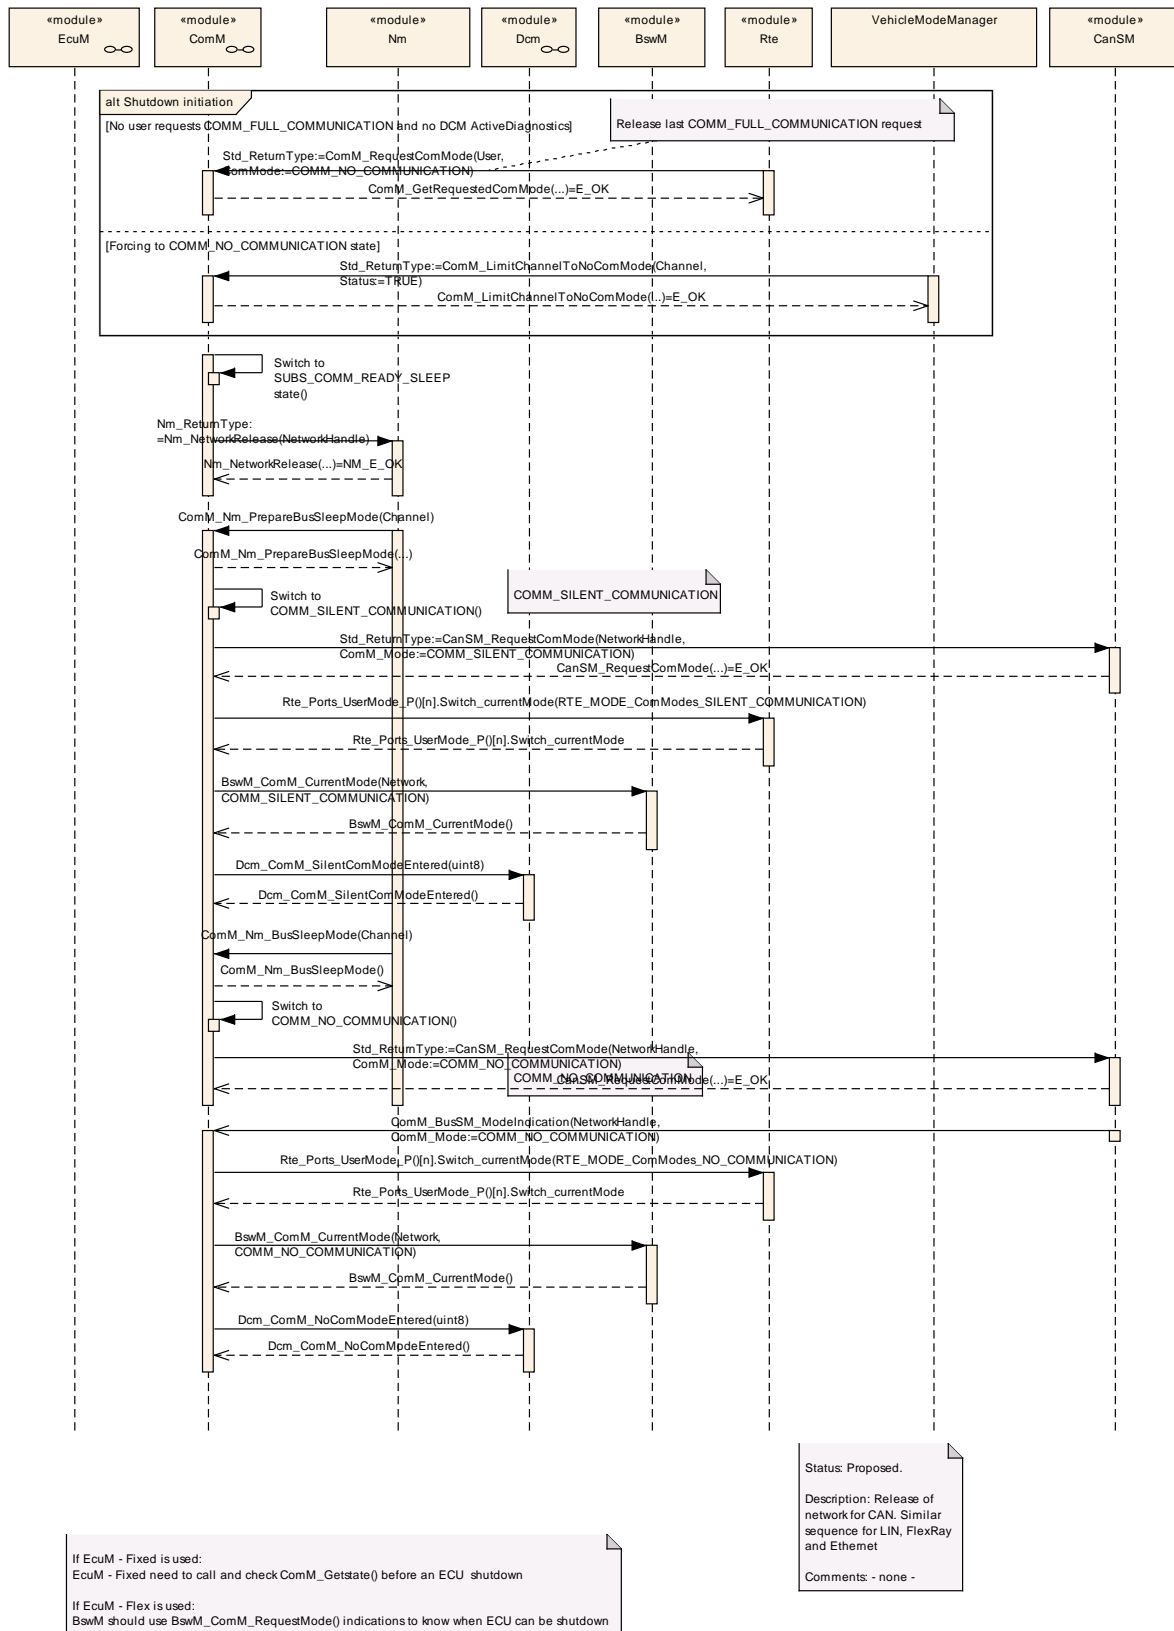

Figure 11: Network shutdown (CAN)

## 9.4 Communication request

Figure 12 shows the possibilities to start `COMM_FULL_COMMUNICATION` on CAN. It can be either initiated if a user requests `COMM_FULL_COMMUNICATION` request or DCM indicates *ComM\_DCM\_ActiveDiagnostic* (see [ComM873](#)). The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

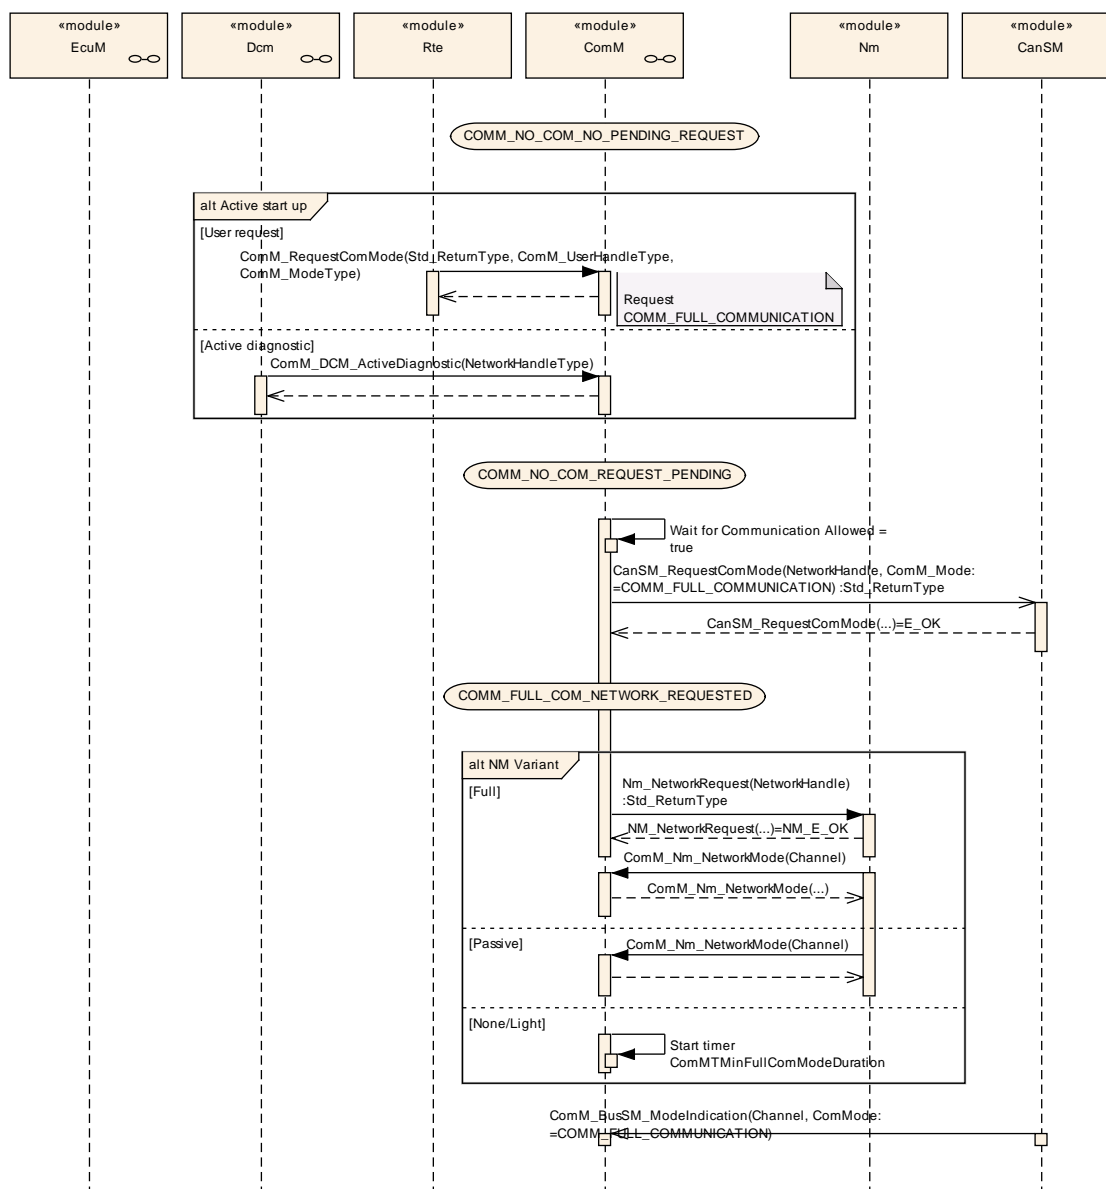

Figure 12: Request Communication

## 10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals.

Chapter 10.2 specifies the structure (containers) and the parameters of the module Communication Manager Module.

Chapter 10.3 specifies published information of the Communication Manager Module.

### 10.1 How to read this chapter

In addition to this section, it is highly recommended to read the documents:

- AUTOSAR Layered Software Architecture [2]
- AUTOSAR ECU Configuration Specification [5]

This document describes the AUTOSAR configuration methodology and the AUTOSAR configuration meta model in detail.

The following is only a short survey of the topic and it will not replace the ECU Configuration Specification document.

#### 10.1.1 Configuration and configuration parameters

Configuration parameters define the variability of the generic part(s) of an implementation of a module. This means that only generic or configurable module implementation can be adapted to the environment (software/hardware) in use during system and/or ECU configuration.

The configuration of parameters can be achieved at different times during the software process: before compile time, before link time or after build time.

In the following, the term “configuration class” (of a parameter) shall be used in order to refer to a specific configuration point in time.

### **10.1.2 Variants**

Variants describe sets of configuration parameters. E.g., variant 1: only pre-compile time configuration parameters; variant 2: mix of pre-compile- and post build time-configuration parameters. In one variant a parameter can only be of one configuration class.

### **10.1.3 Containers**

Containers structure the set of configuration parameters. This means

- *all* configuration parameters are kept in containers.
- (sub-) containers can reference (sub-) containers. It is possible to assign a multiplicity to these references. The multiplicity then defines the possible number of instances of the contained parameters.

### **10.1.4 Specification template for configuration parameters**

The following tables consist of three sections:

- the general section
- the configuration parameter section
- the section of included/referenced containers

Pre-compile time: Specifies whether the configuration parameter shall be of configuration class *Pre-compile time* or not.

<b>Label</b>	<b>Description</b>
x	The configuration parameter shall be of configuration class <i>Pre-compile time</i> .
--	The configuration parameter shall never be of configuration class <i>Pre-compile time</i> .

Link time: Specifies whether the configuration parameter shall be of configuration class *Link time* or not.

<b>Label</b>	<b>Description</b>
x	The configuration parameter shall be of configuration class <i>Link time</i> .
--	The configuration parameter shall never be of configuration class <i>Link time</i> .

Post Build: Specifies whether the configuration parameter shall be of configuration class *Post Build* or not

<b>Label</b>	<b>Description</b>
x	The configuration parameter shall be of configuration class <i>Post Build</i> and no specific implementation is required.
L	<i>Loadable</i> - the configuration parameter shall be of configuration class <i>Post Build</i> and only one configuration parameter set resides in the ECU.
M	<i>Multiple</i> - the configuration parameter shall be of configuration class <i>Post Build</i> and is selected out of a set of multiple parameters by passing a dedicated pointer to the init function of the module.
--	The configuration parameter shall never be of configuration class <i>Post Build</i> .

## 10.2 Containers and configuration parameters

**[ComM457]** «The ComM module configuration shall support a tool based configuration.»(BSW159)

**[ComM419]** «The ComM module pre-compile time and link time configuration parameters shall be checked statically (at the latest during link time) for correctness.»(BSW167)

**[ComM327]** «The ComM module configuration shall support the possibility to assign communication-channels to users by static configuration.»(BSW09133)

**[ComM159]** «The ComM module configuration shall support to configure several communication channels to a user.»(BSW09090)

*Rationale for ComM159:* In a multi channel system each user can be assigned to one or more channels. If the user requests a mode, all channels assigned to this user, shall switch to the corresponding mode. All other channels shall not be affected.

**[ComM160]** «ComMUsers shall be assignable to ComMChannels in combination with all ComMNmVariants except ComMNmVariant = PASSIVE.»()

**[ComM322]** «The ComM module configuration shall support configuration of bus type for each channel.»()

*Rationale for ComM322:* Interfaces for controlling the communication stack depends on the bus type.

**[ComM464]** «The ComM module shall strictly separate configuration from implementation.»(BSW158)

Rationale for ComM464: Easy and clear configuration.

**[ComM456]** 「The ComM module pre-compile time and published configuration data, shall group and export the configuration data to a static configuration interface. The name of the interface shall be `ComM_Cfg.h.`」(BSW00345)

**[ComM460]** 「Files holding configuration data for the ComM module shall have a XML-format that is readable and understandable by human beings.」(BSW160, BSW00334)

### 10.2.1 VARIANT POST-BUILD-SELECTABLE

[ComM998] 「ComM shall support a variant called VARIANT POST-BUILD-SELECTABLE. The supported parameter shall be:

1. ComMPncEnabled  
」()

### 10.2.2 VARIANT-PRE-COMPILE

[ComM549] 「The ComM module shall support a variant called VARIANT-PRE-COMPILE.」(BSW00388)

### 10.2.3 ComM

<b>Module Name</b>	ComM	
<b>Module Description</b>	Configuration of the ComM (Communications Manager) module.	
<b>Included Containers</b>		
<b>Container Name</b>	<b>Multiplicity</b>	<b>Scope / Dependency</b>
ComMConfigSet	1	This container is the base for a multiple configuration set.
ComMGeneral	1	General configuration parameters of the Communication Manager.

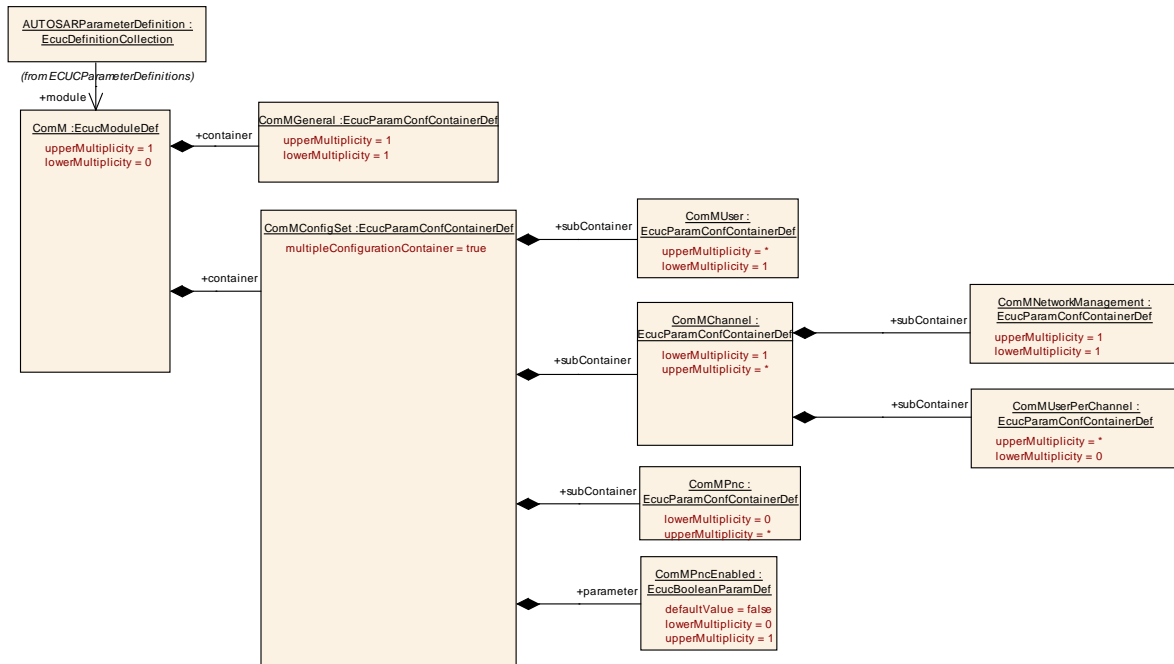

Figure 13: Configuration ComM

## 10.2.4 ComMGeneral

SWS Item	ComM554_Conf :		
Container Name	ComMGeneral{CommunicationManagerConfiguration}		
Description	General configuration parameters of the Communication Manager.		
Configuration Parameters			

SWS Item	ComM555_Conf :		
Name	ComMDevErrorDetect {COMM_DEV_ERROR_DETECT}		
Description	Switches the Development Error Detection and Notification ON or OFF. true: Enabled false: Disabled		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
ConfigurationClass	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: Module		

SWS Item	ComM840_Conf :		
Name	ComMDirectUserMapping {COMM_DIRECT_USER_MAPPING}		
Description	If this parameter is set to true the configuration tool shall automatically create a ComMUser per ComMPnc and a ComMUser per ComMChannel. The shortName of the generated ComMUsers shall follow the following naming convention: PNCUser_ComMPncId, e.g. PNCUser_13 ChannelUser_ComMChannelId, e.g. ChannelUser_25 Restriction: ComMUser, which are created due to this configuration parameter, shall not be used by SWCs (only available for BswM).		
Multiplicity	0..1		
Type	EcucBooleanParamDef		

<b>Default value</b>	false		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: module		

<b>SWS Item</b>	<b>ComM563_Conf :</b>		
<b>Name</b>	ComMEcuGroupClassification {COMM_ECU_GROUP_CLASSIFICATION}		
<b>Description</b>	Defines whether a mode inhibition affects the ECU or not. Examples: 000: No mode inhibition can be activated 001: Wake up inhibition can be enabled Forcing into COMM_NO_COMMUNICATION mode shall be switched on if ComMNmVariant=PASSIVE.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef		
<b>Range</b>	0 .. 255		
<b>Default value</b>	3		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module dependency: Shall be stored none volatile (value must be kept during a reset.). Can be changed during runtime with ComM_SetECUGroupClassification() thus the default values shall be set only once (first ECU initialization).		

<b>SWS Item</b>	<b>ComM560_Conf :</b>		
<b>Name</b>	ComMModeLimitationEnabled {COMM_MODE_LIMITATION_ENABLED}		
<b>Description</b>	true if mode limitation functionality shall be enabled. true: Enabled false: Disabled		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	false		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module dependency: Shall be true if ComMNmVariant=COMM_PASSIVE		

<b>SWS Item</b>	<b>ComM887_Conf :</b>		
<b>Name</b>	ComMPncGatewayEnabled {COMM_PNC_GW_ENABLED}		
<b>Description</b>	Enables or disables support of Partial Network Gateway. False: Partial Networking Gateway is disabled True: Partial Networking Gateway is enabled		
<b>Multiplicity</b>	0..1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	false		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: module		

<b>SWS Item</b>	<b>ComM841_Conf :</b>		
<b>Name</b>	ComMPncPrepareSleepTimer {COMM_T_PNC_PREPARE_SLEEP}		
<b>Description</b>	Time in seconds the PNC state machine shall wait in PNC_PREPARE_SLEEP.		
<b>Multiplicity</b>	0..1		

Type	EcucFloatParamDef		
Range	0 .. 63		
Default value	--		
ConfigurationClass	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: Module		

SWS Item	ComM839_Conf :		
Name	ComMPncSupport {COMM_PNC_SUPPORT}		
Description	Enables or disables support of partial networking. False: Partial Networking is disabled True: Partial Networking is enabled		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
ConfigurationClass	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: module		

SWS Item	ComM695_Conf :		
Name	ComMSynchronousWakeUp {COMM_SYNCHRONOUS_WAKE_UP}		
Description	Wake up of one channel shall lead to a wake up of all channels if true. true: Enabled false: Disabled		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	true		
ConfigurationClass	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: module		

SWS Item	ComM557_Conf :		
Name	ComMTMinFullComModeDuration {COMM_T_MIN_FULL_COM_MODE_DURATION}		
Description	Minimum time duration in seconds, spent in the COMM_FULL_COMMUNICATION sub-state COMM_FULL_COM_NETWORK_REQUESTED.		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	0.001 .. 65		
Default value	5		
ConfigurationClass	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: Module		

SWS Item	ComM622_Conf :		
Name	ComMVersionInfoApi {COMM_VERSION_INFO_API}		
Description	Switches the possibility to read the published information with the service ComM_GetPublishedInformation(). true: Enabled false: Disabled		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	true		
ConfigurationClass	Pre-compile time	X	All Variants

	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module		

<b>SWS Item</b>	<b>ComM559_Conf :</b>		
<b>Name</b>	ComMWakeupInhibitionEnabled {COMM_WAKEUP_INHIBITION_ENABLED}		
<b>Description</b>	true if wake up inhibition functionality enabled. true: Enabled false: Disabled		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	false		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module		

<b>SWS Item</b>	<b>ComM783_Conf :</b>		
<b>Name</b>	ComMGlobalNvMBlockDescriptor {COMM_GlobalNvMBlockDescriptor}		
<b>Description</b>	Reference to NVRAM block containing the none volatile data. If this parameter is not configured it means that no NVRam is used at all.		
<b>Multiplicity</b>	0..1		
<b>Type</b>	Reference to [ NvMBlockDescriptor ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: ECU dependency: Derived from NvM configuration		

<b>No Included Containers</b>
-------------------------------

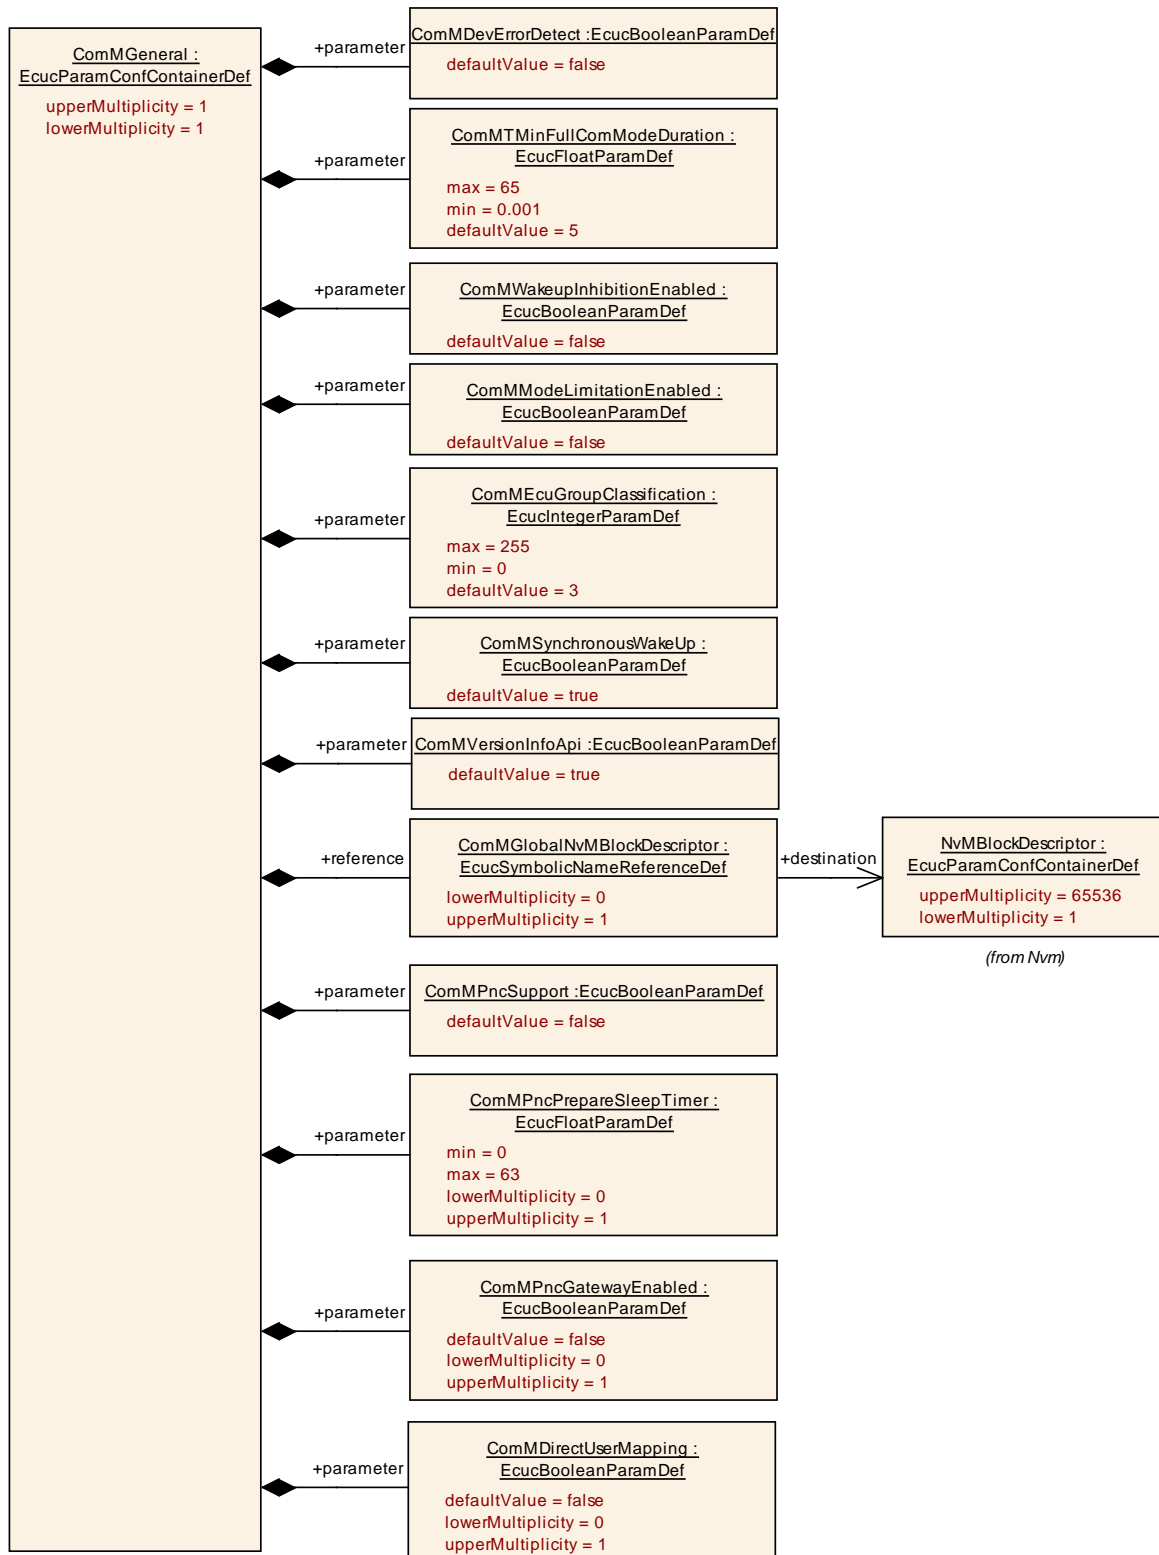

Figure 14: Configuration ComMGeneral

### 10.2.5 ComMConfigSet

<b>SWS Item</b>	<b>ComM879_Conf :</b>
<b>Container Name</b>	ComMConfigSet [Multi Config Container]
<b>Description</b>	This container is the base for a multiple configuration set.
<b>Configuration Parameters</b>	

<b>SWS Item</b>	<b>ComM878_Conf :</b>		
<b>Name</b>	ComMPncEnabled {COMM_PNC_ENABLED}		
<b>Description</b>	Defines whether in this configuration set the partial networking is enabled. true: Enabled false: Disabled		
<b>Multiplicity</b>	0..1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	false		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	VARIANT-PRE-COMPILE
	<b>Link time</b>	--	
	<b>Post-build time</b>	X	VARIANT-POST-BUILD
<b>Scope / Dependency</b>	dependency: ComMPncSupport		

<b>Included Containers</b>		
<b>Container Name</b>	<b>Multiplicity</b>	<b>Scope / Dependency</b>
ComMChannel	1..*	This container contains the configuration (parameters) of the bus channel(s). The channel parameters shall be harmonized within the whole communication stack.
ComMPnc	0..*	This container contains the configuration of the partial network cluster (PNC).
ComMUser	1..*	This container contains a list of identifiers that are needed to refer to a user in the system which is designated to request Communication modes.

### 10.2.6 ComMUser

<b>SWS Item</b>	<b>ComM653_Conf :</b>
<b>Container Name</b>	ComMUser{CommunicationManagerUser}
<b>Description</b>	This container contains a list of identifiers that are needed to refer to a user in the system which is designated to request Communication modes.
<b>Configuration Parameters</b>	

<b>SWS Item</b>	<b>ComM654_Conf :</b>		
<b>Name</b>	ComMUserIdentifier {COMM_USER}		
<b>Description</b>	An identifier that is needed to refer to a user in the system which is designated to request Communication Modes. ImplementationType: ComM_UserHandleType		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
<b>Range</b>	0 .. 255		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module		

	dependency: EcuMUser: The concept of users is very similar to the concept of requestors in the ECU State Manager specification. These two parameters shall be harmonized during the configuration process.
--	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<b>SWS Item</b>	<b>ComM786 Conf :</b>		
<b>Name</b>	ComMUserEcuPartitionRef		
<b>Description</b>	Denotes in which "EcuPartition" the requester is executed. When the partition is stopped, the communication request shall be cancelled in the ComM to avoid a stay-awake situation of the bus due to a stopped partition.		
<b>Multiplicity</b>	0..1		
<b>Type</b>	Reference to [ EcuPartition ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

#### No Included Containers

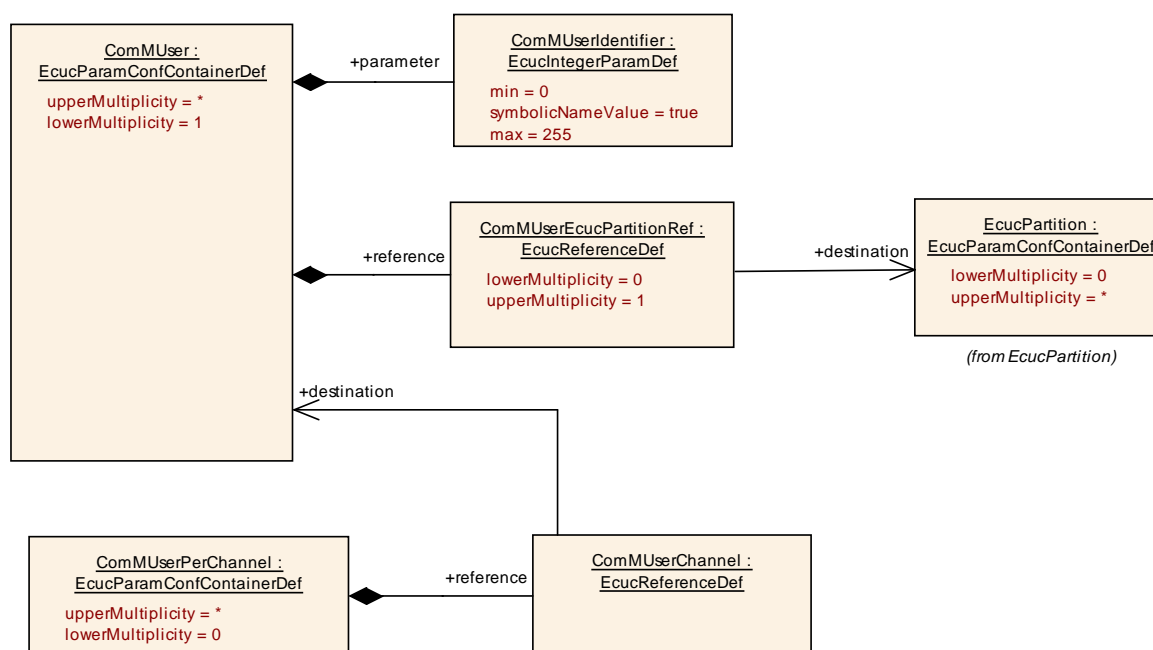

Figure 15: Configuration ComMUser

### 10.2.7 ComMChannel

<b>SWS Item</b>	<b>ComM565 Conf :</b>
<b>Container Name</b>	ComMChannel{Channel}
<b>Description</b>	This container contains the configuration (parameters) of the bus channel(s). The channel parameters shall be harmonized within the whole communication stack.

**Configuration Parameters**

<b>SWS Item</b>	<b>ComM567_Conf :</b>		
<b>Name</b>	ComMBusType {COMM_BUS_TYPE}		
<b>Description</b>	Identifies the bus type of the channel.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucEnumerationParamDef		
<b>Range</b>	COMM_BUS_TYPE_CAN	--	
	COMM_BUS_TYPE_ETH	--	
	COMM_BUS_TYPE_FR	--	
	COMM_BUS_TYPE_INTERNAL	--	
	COMM_BUS_TYPE_LIN	--	
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: ECU		

<b>SWS Item</b>	<b>ComM635_Conf :</b>		
<b>Name</b>	ComMChannelId {COMM_CHANNEL_ID}		
<b>Description</b>	Channel identification number of the corresponding channel.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
<b>Range</b>	0 .. 255		
<b>Default value</b>	--		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: ECU dependency: Shall be harmonized with channel IDs of networkmanagement and the bus interfaces.		

<b>SWS Item</b>	<b>ComM787_Conf :</b>		
<b>Name</b>	ComMFullCommRequestNotificationEnabled {COMM_FULL_COMM_REQUEST_NOTIFICATION_ENABLED}		
<b>Description</b>	Defines if the optional SenderReceiver Port of Interface ComM_CurrentChannelRequest will be provided for this channel. True means enabled. False means disabled		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	false		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module dependency: Shall be stored none volatile (value must be kept during a reset).		

<b>SWS Item</b>	<b>ComM789_Conf :</b>		
<b>Name</b>	ComMGlobalNvmBlockDescriptor {COMM_NO_WAKEUP_INHIBITION_NVM_STORAGE}		
<b>Description</b>	If this parameter is set to "true", the NoWakeUp inhibition state of the channel shall be stored (in some implementation specific way) in the block pointed to by ComMGlobalNvmBlockDescriptor.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	--		

<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module dependency: If the parameter is set to true, a valid Nvm block reference must be given in the (existing, i.e. multiplicity 1) ComMGlobalNvmBlockDescriptor pointing to a sufficiently big Nvm block.		

<b>SWS Item</b>	<b>ComM556_Conf :</b>		
<b>Name</b>	ComMMainFunctionPeriod {COMM_MAIN_FUNCTION_PERIOD}		
<b>Description</b>	Specifies the period in seconds that the MainFunction has to be triggered with. Comment: ComM scheduling shall be at least as fast as the communication stack and a schedule longer than 100ms makes no sense for communication.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucFloatParamDef		
<b>Range</b>	0.001 .. 0.1		
<b>Default value</b>	0.02		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: ECU		

<b>SWS Item</b>	<b>ComM571_Conf :</b>		
<b>Name</b>	ComMNoCom {COMM_NO_COM}		
<b>Description</b>	Not allowed to change state of ComM channel to COMM_SILENT_COMMUNICATION or COMM_FULL_COMMUNICATION. true: Enabled - Not allowed to switch to Communication Modes above. false: Disabled - Allowed to switch Communication Modes above. Shall be possible to change parameter during runtime with ComM API's. ECU/All channels: ComM_LimitECUToNoComMode(). Separate channels: ComM_LimitChannelToNoComMode().		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	false		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module dependency: ComMModeLimitationEnabled		

<b>SWS Item</b>	<b>ComM569_Conf :</b>		
<b>Name</b>	ComMNoWakeup {COMM_NO_WAKEUP}		
<b>Description</b>	Defines if an ECU is not allowed to wake-up the channel. true: Enabled (not allowed to wake-up) false: Disabled This is the default/init value of a runtime variable that can be changed during runtime using ComM_PreventWakeUp().		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	false		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module dependency: Shall be stored none volatile (value must be kept during a reset).		

<b>SWS Item</b>	<b>ComM842_Conf :</b>		
<b>Name</b>	ComMPncGatewayType {COMM_PNC_GW_TYPE}		
<b>Description</b>	Identifies the Partial Network Gateway behaviour of a ComMChannel.		
<b>Multiplicity</b>	0..1		
<b>Type</b>	EcucEnumerationParamDef		
<b>Range</b>	COMM_GATEWAY_TYPE_ACTIVE	--	
	COMM_GATEWAY_TYPE_PASSIVE	--	
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: ECU		

<b>Included Containers</b>		
<b>Container Name</b>	<b>Multiplicity</b>	<b>Scope / Dependency</b>
ComMNetworkManagement	1	This container contains the configuration parameters of the networkmanagement.
ComMUserPerChannel	0..*	This container contains a list of identifiers that are needed to refer to a user in the system which is linked to a channel.

[ComM690] 「 Configuration parameter ComMNoCom (see [ComM571\\_Conf](#)) need not to be evaluated in case ComMModeLimitationEnabled = FALSE = Disabled (see [ComM560\\_Conf](#)) thus it can be removed in that case to reduce/optimize the configuration.」()

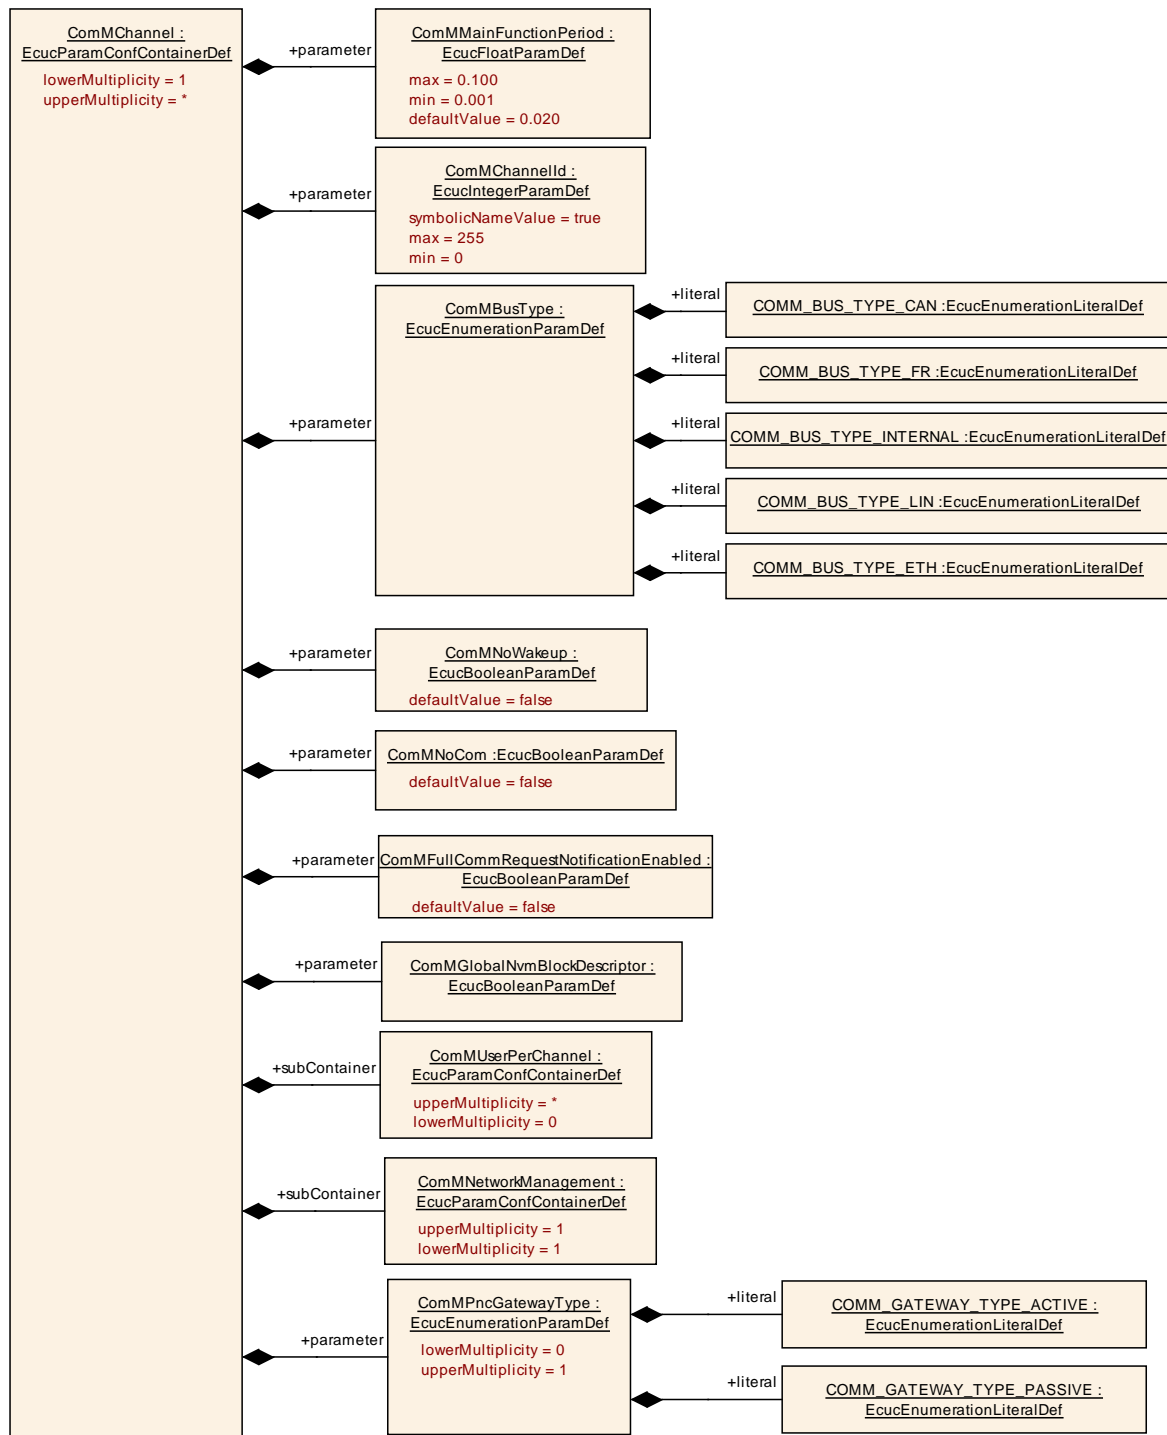

Figure 16: Configuration ComMChannel

## 10.2.8 ComMNetworkManagement

<b>SWS Item</b>	<b>ComM607_Conf :</b>
<b>Container Name</b>	ComMNetworkManagement{Networkmanagement}
<b>Description</b>	This container contains the configuration parameters of the

	networkmanagement.
<b>Configuration Parameters</b>	

<b>SWS Item</b>	<b>ComM606_Conf :</b>		
<b>Name</b>	ComMNmLightTimeout {COMM_NM_LIGHT_TIMEOUT}		
<b>Description</b>	Defines the timeout (in seconds) after COMM_FULL_COMMUNICATION sub-state COMM_FULL_COM_READY_SLEEP is left. The range shall be greater than 0.0 and less or equal to 255.0.		
<b>Multiplicity</b>	0..1		
<b>Type</b>	EcucFloatParamDef		
<b>Range</b>	0 .. 255		
<b>Default value</b>	10		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module dependency: Only used if ComMNmVariant is configured as ComMLight		

<b>SWS Item</b>	<b>ComM568_Conf :</b>		
<b>Name</b>	ComMNmVariant {COMM_NM_VARIANT}		
<b>Description</b>	Defines the functionality of the networkmanagement. Shall be harmonized with NM configuration.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucEnumerationParamDef		
<b>Range</b>	FULL	AUTOSAR NM available (default). (default)	
	LIGHT	No AUTOSAR NM available but functionality to shut down a channel.	
	NONE	No NM available	
	PASSIVE	AUTOSAR NM running in passive mode available.	
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module dependency: ComMNmVariant shall be NONE if ComMBusType = COMM_BUS_TYPE_INTERNAL		

<b>SWS Item</b>	<b>ComM886_Conf :</b>		
<b>Name</b>	ComMPncNmRequest {COMM_PNC_NM_REQUEST}		
<b>Description</b>	If this parameter equals true then every time a FULL Communication is requested due to a change in the PNC state machine to PNC_REQUESTED Nm shall be called using the API Nm_NetworkRequest.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucBooleanParamDef		
<b>Default value</b>	false		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	scope: Module		

<b>No Included Containers</b>
-------------------------------

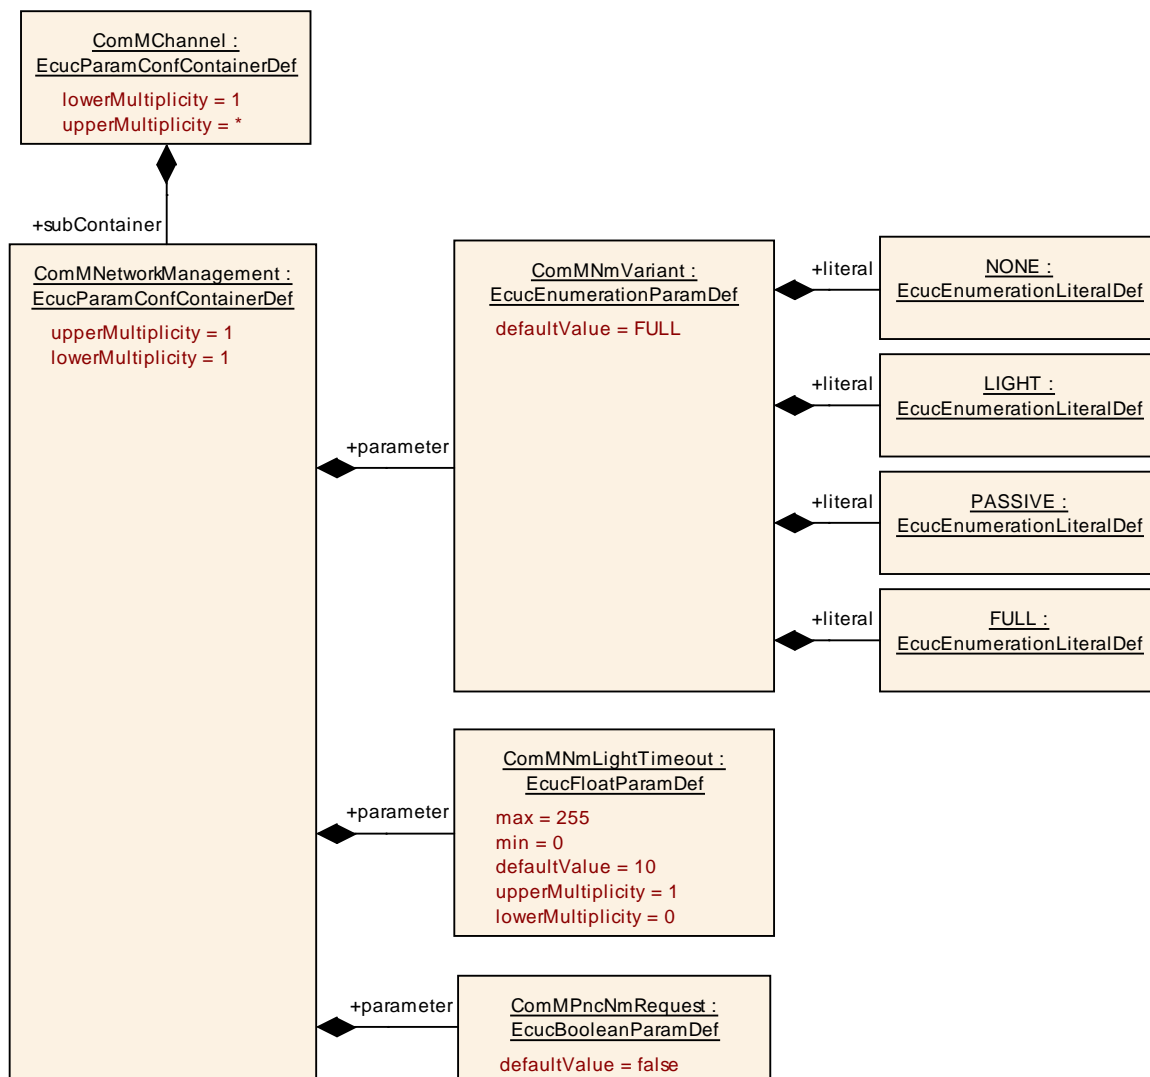

Figure 17: Configuration ComMNetworkManagement

### 10.2.9 ComMUserPerChannel

SWS Item	ComM657_Conf :
Container Name	ComMUserPerChannel{UserPerChannel}
Description	This container contains a list of identifiers that are needed to refer to a user in the system which is linked to a channel.
Configuration Parameters	

<b>SWS Item</b>	<b>ComM658_Conf :</b>		
<b>Name</b>	ComMUserChannel		
<b>Description</b>	Reference to the ComMUser that corresponds to this channel user. ImplementationType: COMM_UserHandleType		
<b>Multiplicity</b>	1		
<b>Type</b>	Reference to [ ComMUser ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	

<b>Scope / Dependency</b>	
---------------------------	--

#### No Included Containers

### 10.2.10 ComMPnc

<b>SWS Item</b>	<b>ComM843_Conf :</b>
<b>Container Name</b>	ComMPnc
<b>Description</b>	This container contains the configuration of the partial network cluster (PNC).
<b>Configuration Parameters</b>	

SWS Item	ComM874_Conf :		
Name	ComMPncId {COMM_PNC_ID}		
Description	Partial network cluster identification number.		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 47		
Default value	--		
ConfigurationClass	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: ECU		

<b>SWS Item</b>	<b>ComM880_Conf :</b>		
<b>Name</b>	ComMChannelPerPnc		
<b>Description</b>	Reference to the ComMChannel that is required for this PNC. ImplementationType: COMM_ChannelType		
<b>Multiplicity</b>	1..*		
<b>Type</b>	Reference to [ ComMChannel ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>ComM876_Conf :</b>		
<b>Name</b>	ComMUserPerPnc		
<b>Description</b>	Reference to the ComMUsers that correspond to this PNC. ImplementationType: COMM_UserHandleType		
<b>Multiplicity</b>	0..*		
<b>Type</b>	Reference to [ ComMUser ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>Included Containers</b>		
<b>Container Name</b>	<b>Multiplicity</b>	<b>Scope / Dependency</b>
ComMPncComSignal	0..*	Represents the PncComSignals which are used to communicate the EIRA and ERA status of this PNC.

## 10.2.11 ComMPncComSignal

<b>SWS Item</b>	<b>ComM881_Conf :</b>
<b>Container Name</b>	ComMPncComSignal
<b>Description</b>	Represents the PncComSignals which are used to communicate the EIRA and ERA status of this PNC.
<b>Configuration Parameters</b>	

SWS Item	ComM885_Conf :		
Name	ComMPncComSignalDirection		
Description	Indicates the communication direction of this PncComSignal.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	RX	--	
	TX	--	
ConfigurationClass	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency			

<b>SWS Item</b>	<b>ComM883_Conf :</b>		
<b>Name</b>	ComMPncComSignalKind		
<b>Description</b>	Indicates whether this PncComSignal represents EIRA or ERA PNC information.		
<b>Multiplicity</b>	1		
<b>Type</b>	EcucEnumerationParamDef		
<b>Range</b>	EIRA	--	
	ERA	--	
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

<b>SWS Item</b>	<b>ComM884_Conf :</b>		
<b>Name</b>	ComMPncComSignalChannelRef		
<b>Description</b>	Reference to the ComMChannel which is used to determine whether this PncComSignal shall participate in the active or passive role (via the parameter ComMPncGatewayType of the ComMChannel). Not applicable if ComMPncComSignalKind is EIRA.		
<b>Multiplicity</b>	0..1		
<b>Type</b>	Reference to [ ComMChannel ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>	dependency: ComMPncGatewayEnabled		

<b>SWS Item</b>	<b>ComM882_Conf :</b>		
<b>Name</b>	ComMPncComSignalRef		
<b>Description</b>	Reference to the ComSignal which is used to transport the partial network channel request information.		
<b>Multiplicity</b>	1		
<b>Type</b>	Reference to [ ComSignal ]		
<b>ConfigurationClass</b>	<b>Pre-compile time</b>	X	All Variants
	<b>Link time</b>	--	
	<b>Post-build time</b>	--	
<b>Scope / Dependency</b>			

### 10.3 Published information

**[ComM280]** 「The standardized common published parameters as required by BSW00402 in the General Requirements on Basic Software Modules [3] shall be published within the header file of this module and need to be provided in the BSW Module Description. The according module abbreviation can be found in the List of Basic Software Modules [1].」(BSW003, BSW00318, BSW00374, BSW00379, BSW00402)

Additional module-specific published parameters are listed below if applicable.

**[ComM469]** 「Enumeration of module version numbers shall be according the BSW General Requirements (for details refer to AUTOSAR General Requirements on Basic Software Modules [3]).」(BSW00321)

**[ComM418]** 「The version information in the module header and source files shall be validated and consistent (e.g. by comparing the version information in the module header and source files with a pre-processor macro).」(BSW004)

## 11 Changes during SWS Improvements by Technical Office for version 2.0.0

### 11.1 Deleted SWS Items

<b>SWS Item</b>	<b>Rationale</b>
ComM28	Requirement ID deleted (no requirement described)
ComM33	Requirement ID deleted (no requirement described)
ComM35	Requirement ID deleted (no requirement described)

## 11.2 Replaced SWS Items

SWS Item of Release 1	replaced by SWS Item	Rationale
ComM304	<a href="#">ComM839</a> , <a href="#">ComM840</a>	Requirement split up in several requirements
ComM424	<a href="#">ComM841</a> , <a href="#">ComM842</a>	Requirement split up in several requirements

ComM688	<a href="#">ComM831</a> , <a href="#">ComM832</a>	Requirement split up in several requirements

## 11.3 Changed SWS Items

<b>SWS Item</b>	<b>Rationale</b>
<a href="#">ComM084</a>	Redundant requirement in first sentence separated as explanation
<a href="#">ComM283</a>	Requirement and explanation separated.
<a href="#">ComM328</a>	Requirement and rationale separated.
<a href="#">ComM686</a>	Requirement and rationale separated.
<a href="#">ComM733</a>	Requirement and explanation separated.
<a href="#">ComM740</a>	Requirement and explanation separated.
<a href="#">ComM747</a>	Requirement and explanation separated.
<a href="#">ComM752</a>	Requirement and explanation separated.
<a href="#">ComM778</a>	Requirement, comment , and implementation hint separated

## 11.4 Added SWS Items

<b>SWS Item</b>	<b>Rationale</b>
<a href="#">ComM820</a>	Added standard requirement
<a href="#">ComM822</a>	Added standard requirement
<a href="#">ComM823</a>	Added standard requirement
<a href="#">ComM824</a>	Added standard requirement
<a href="#">ComM828</a>	Added standard requirement
<a href="#">ComM829</a>	Added standard requirement
<a href="#">ComM831</a>	Added identified requirement
<a href="#">ComM832</a>	Added identified requirement
<a href="#">ComM835</a>	Added identified requirement
<a href="#">ComM836</a>	Added identified requirement
<a href="#">ComM837</a>	Added identified requirement
<a href="#">ComM838</a>	Added identified requirement
<a href="#">ComM839</a>	Added identified requirement
<a href="#">ComM840</a>	Added identified requirement
<a href="#">ComM841</a>	Added identified requirement
<a href="#">ComM842</a>	Added identified requirement

## 12 Changes during rework for Release 4.0

### 12.1 Deleted SWS Items

SWS Item	Rationale
ComM281	Removed because BSW09088 removed
ComM283	High level requirement removed
ComM504	Requirement (no-requirement described)
ComM471	Requirement
ComM271	Requirement removed, covered by ComM515
ComM068	Redundant with ComM484
ComM072	Requirement now covered in ComM071
ComM561_Conf	Same name ComMNoCom for ECU as for ComMNoCom for channels (ComM571_Conf) Naming conflict in configuration, Consequence: API ComM_LimitECUToNoComMode() need to operate on all ComMNoCom (ComM571_Conf).
ComM689	Requirement related to obsolete ComM561_Conf
ComM831	Requirement covered by ComM073
ComM832	Requirement covered by ComM784
ComM328	Redundant with ComM418
ComM355	Force ECU Reset requirement moved to BswM
ComM558_Conf	Force ECU Reset requirement moved to BswM
ComM216	Covered by ComM215 after ComM561_Conf removed (215 per channel vs. 216 all channels)
ComM570_Conf	ComMNoFullCom requirement is obsolete and now covered by ComM571, since it is not allowed to request COMM_SILENT_COMMUNICATION
ComM691	obsolete, see comment above. evaluation requirement on ComM570_Conf
ComM844	ComM does not contain any post build time configurable parameters
ComM070	Requirement what shall not be done, replaced with comment
ComM128, ComM130	Removed due to new EcuM-ComM interaction concept
ComM458	Negative requirement removed (not implement interrupt service routines)
ComM640	Negative requirement removed (do not use OS timers and resources directly)
ComM361	Negative requirement removed (ComM shall not support multiple (re-entrant) "Limit to No Communication" requests)
ComM354	Obsolete, DCM no longer require connection of all channels.
ComM239	Obsolete, ComM no longer request RUN from EcuM
<b>R4.0 Rev 3</b>	
ComM507	removal of Dem Error Reporting
ComM508	removal of Dem Error Reporting
ComM515	removal of Dem Error Reporting
ComM634	removal of Dem Error Reporting
ComM901	Because the BusSMs have to store the communication mode request, the repetition of an unchanged communication mode request is useless.
ComM905	Replaced by Sequence Charts
ComM621	removal of Dem Error Reporting
ComM513	removal of Dem Error Reporting

### 12.2 Replaced SWS Items

SWS Item	replaced by SWS Item	Rationale
ComM835, ComM836	<a href="#">ComM478</a>	Revert TO change, requirement split up in several requirements
ComM289	<a href="#">ComM866</a>	Channel parameter added in

		ComM_DCM_ActiveDiagnostic call back function (Should no longer affect all channels)
ComM484	<a href="#">ComM867</a> , <a href="#">ComM868</a>	Requirement split up in several requirements
ComM129	<a href="#">ComM869</a> , <a href="#">ComM870</a>	Requirement split up in several requirements
ComM406	<a href="#">ComM871</a>	ComM_EcuM_RunModeIndication replaced with new API ComM_CommunicationAllowed.
ComM362	<a href="#">ComM873</a>	Channel parameter added to DCM interface
ComM364	<a href="#">ComM874</a>	Channel parameter added to DCM interface
ComM784	<a href="#">ComM875</a> , <a href="#">ComM876</a>	Requirement split up in several requirements
ComM785	<a href="#">ComM877</a> , <a href="#">ComM878</a>	Requirement split up in several requirements
ComM190	<a href="#">ComM879</a> , <a href="#">ComM880</a>	Requirement split up in several requirements
ComM479	<a href="#">ComM882</a> , <a href="#">ComM883</a>	Requirement split up in several requirements
ComM478,ComM205,ComM311	<a href="#">ComM888</a> , <a href="#">ComM889</a> , <a href="#">ComM890</a>	ComM478 Requirement split up in several requirements, dependent on NM variant. Req. of "state duration extensions" for NM variant LIGHT and NONE, ComM205 and ComM311, moved from 7.2 channel state machine requirements section. 7.1, to avoid confusion.
ComM207	<a href="#">ComM893</a> , <a href="#">ComM894</a>	Requirement split up in several requirements

## 12.3 Changed SWS Items

SWS Item	Rationale
ComM649	COMM_UNINIT = 3 changed to COMM_E_UNINIT. (was conflict with COMM_UNINIT = 0 in 8.2.1)
ComM071	Changed to also cover ComM072, hence ComM072 now redundant and removed (COMM_SILENT_COMMUNICATION= switch on the reception and switch off the transmission capability)
ComM463	Removed ComM_PBcfg.c from requirement, no post build parameters
ComM829	Removed EcuM_SelectShutdownTarget and EcuM_KillAllRUNRequests
ComM470	Removed exception for "state duration extension" since moved from this section to channel state machine section
ComM218	Replaced obsolete "silent communication" substate "Network released" with state COMM_SILENT_COMMUNICATION
ComM296	Removed 'ComM_Nm_RestartIndication' (ComM792), from requirement, ComM cannot receive this indication in this state, COMM_SILENT_COMMUNICATION (NMif shall send a bussSleep indication before, and "restart" will be taken care of in COMM_NO_COMMUNICATION)
ComM219	Removed COMM_SILENT_COMMUNICATION due to contradiction to ComM218
R4.0 Rev 3	
ComM234, ComM828	removal of Dem Error Reporting
ComM473	Module Short Name --> Module Abreviation
ComM733, ComM778	now only valid for users to which a SW-C is mapped
ComM820	Removal of Nm_ConfigType, Dem_ErrorTypes.h, add PNCHandleType
ComM742	Add querying of Inhibition Status

<a href="#">ComM906</a>	rewrite to RTE interface type ,moved to chapter 7.14.3.4.2
-------------------------	------------------------------------------------------------

## 12.4 Added SWS Items

<b>SWS Item</b>	<b>Rationale</b>
<a href="#">ComM133</a>	Revert TO change to remove ComM133
<a href="#">ComM844</a>	Requirement on <code>ComM_PBcfg.c</code> (previously included in ComM503)
<a href="#">ComM845</a>	Added requirement for "Full Communication Mode"
<a href="#">ComM846</a>	Added requirement for "No Communication Mode"
<a href="#">ComM847</a>	AUTOSAR port providing the sender-receiver interface 'ComM_CurrentMode'.
<a href="#">ComM848</a>	AUTOSAR port to allow the request of an communication mode by calling 'ComM_RequestComMode'
<a href="#">ComM850</a>	Requirement for Debugging Concept
<a href="#">ComM851</a>	Requirement for Debugging Concept
<a href="#">ComM852</a>	Requirement for use of Flexray interface
<a href="#">ComM853</a>	Requirement for use of Flexray interface
<a href="#">ComM854</a>	Requirement for use of CAN State Manager interface
<a href="#">ComM855</a>	Requirement for use of CAN State Manager interface
<a href="#">ComM856</a>	Requirement for use of LIN State Manager interface
<a href="#">ComM857</a>	Requirement for use of LIN State Manager interface
<a href="#">ComM858</a>	Requirement to report development error to DET
<a href="#">ComM859</a>	Requirement for use of Ethernet interface
<a href="#">ComM860</a>	Requirement for use of Ethernet interface
<a href="#">ComM863</a>	Requirement for use of ComM types
<a href="#">ComM864</a>	Requirement when non-volatile data shall be read from NVRAM
<a href="#">ComM865</a>	Requirement when non-volatile data shall be written to NVRAM
<a href="#">ComM866</a>	Requirement for changed DCM API (channel parameter added)
<a href="#">ComM867</a>	ComM484 splitted in two requirements, part1
<a href="#">ComM868</a>	ComM484 splitted in two requirements, part2
<a href="#">ComM869</a>	ComM129 splitted in two requirements, part1
<a href="#">ComM870</a>	ComM129 splitted in two requirements, part2
<a href="#">ComM871</a>	Added new API <code>ComM_CommunicationAllowed</code>
<a href="#">ComM872</a>	Added new API <code>ComM_GetState</code>
<a href="#">ComM873</a>	Added channel parameter in DCM interface
<a href="#">ComM874</a>	Added channel parameter in DCM interface
<a href="#">ComM875</a>	ComM784 splitted in two requirements, part1
<a href="#">ComM876</a>	ComM784 splitted in two requirements, part2
<a href="#">ComM877</a>	ComM785 splitted in two requirements, part1
<a href="#">ComM878</a>	ComM785 splitted in two requirements, part2
<a href="#">ComM879</a>	ComM channel state machine Main states
<a href="#">ComM880</a>	ComM channel state machine sub-states in <code>COMM_FULL_COMMUNICATION</code>
<a href="#">ComM881</a>	ComM channel state machine sub-states in <code>COMM_NO_COMMUNICATION</code>
<a href="#">ComM882</a>	ComM479 splitted in two requirements, part1
<a href="#">ComM883</a>	ComM479 splitted in two requirements, part2
<a href="#">ComM884</a>	Requirement for storing of <code>CommunicationAllowed</code> flags
<a href="#">ComM885</a>	Requirement for changing value of <code>CommunicationAllowed</code> flags
<a href="#">ComM886</a>	Define when timer <code>ComMMinFullComModeDuration</code> shall be started.
<a href="#">ComM887</a>	Define when timer <code>ComMMinFullComModeDuration</code> shall be stopped
<a href="#">ComM888</a>	ComM478 splitted in three requirements, part1
<a href="#">ComM889</a>	ComM478 splitted in three requirements, part2
<a href="#">ComM890</a>	ComM478 splitted in three requirements, part3
<a href="#">ComM891</a>	Requirement for starting <code>ComMNmLightTimeout</code> timer
<a href="#">ComM892</a>	Requirement for cancel <code>ComMNmLightTimeout</code> timer
<a href="#">ComM893</a>	ComM207 splitted in two requirements, part1
<a href="#">ComM894</a>	ComM207 splitted in two requirements, part2

<a href="#">ComM895</a>	Requirement to evaluate communication allowed status i sub-state COMM_NO_COM_REQUEST_PENDING
<a href="#">ComM896</a>	Only allowed to evaluate communication allowed status i sub-state COMM_NO_COM_REQUEST_PENDING
<a href="#">ComM897</a>	Requirment to be able switch back from COMM_NO_COM_REQUEST_PENDING to default sub-state COMM_NO_COM_NO_PENDING_REQUEST if no longer any pending request.
<a href="#">ComM898</a>	Requirement for initial sub-state in COMM_NO_COMMUNICATION
<a href="#">ComM899</a>	Add requirement for sub-state when entering state COMM_FULL_COMMUNICATION
<a href="#">ComM900</a>	If NM variant = PASSIVE and NM indicate 'prepare bus sleep' ComM channel state machine shall switch to COMM_SILENT_COMMUNICATION
<a href="#">ComM901</a>	Add requirement to re-send mode request if not corrected mode indication is received.
<a href="#">ComM902</a>	call of Nm_PassiveStartup if ComM_Nm_RestartIndication
<a href="#">ComM903</a>	call of Nm_PassiveStartup if ComM_Nm_NetworkStartIndication
<a href="#">ComM904</a>	Add requirement for ComM_CurrentChannelRequest
R4.0 Rev 3	
ComM160	Forbid assigning ComM users to channels with NmVariant=PASSIVE
ComM956	Include Structure of Services now does respect BSW00447
ComM499	Formal Requirement added by CM

### 12.4.1 Added Requirements for Partial Networking Functionality

SWS Item	Rationale
ComM907,ComM908,ComM909,ComM910,ComM911, ComM912,ComM913,ComM916,ComM919,ComM920, ComM921,ComM922,ComM923,ComM924,ComM925, ComM926,ComM927,ComM929,ComM931,ComM932, ComM933,ComM934,ComM935,ComM936,ComM937, ComM938,ComM939,ComM940,ComM941,ComM942, ComM943,ComM944,ComM945,ComM946,ComM947, ComM948,ComM950,ComM951,ComM952,ComM953, ComM955,ComM959,ComM960,ComM964,ComM966, ComM971,ComM972,ComM975,ComM976,ComM978, ComM979,ComM980,ComM981,ComM982,ComM984, ComM985,ComM986,ComM987,ComM990,ComM991, ComM992,ComM993,ComM994,ComM995,ComM996, ComM997,ComM999	Partial Networking Functionality

## 13 Not applicable requirements

**[ComM499]** 「 These requirements are not applicable to this specification. 」

(BSW005, BSW009, BSW010, BSW161, BSW162, BSW164, BSW168, BSW170, BSW00314, BSW00325, BSW00326, BSW00341, BSW00343, BSW00344, BSW00353, BSW00361, BSW00375, BSW00378, BSW00398, BSW00399, BSW00400, BSW00404, BSW00405, BSW00413, BSW00416, BSW00417, BSW00422, BSW00423, BSW00424, BSW00425, BSW00426, BSW00427, BSW00428, BSW00429, BSW00431, BSW00432, BSW00433, BSW00434, BSW00437, BSW00438, BSW00439)
